## KRATOS GENERAL MICROWAVE COMPANY PROFILE

Kratos General Microwave is one of the largest international independent microwave companies with over 30 years of proven experience in the market. Our products are used in a variety of demanding environments including airborne, ground and naval systems.

Kratos General Microwave is a recognized worldwide leader in the design and manufacture of high performance, state-of-the-art Microwave components and subassemblies for the defense as well as non-defense markets. We are supporting a wide range of requirements with catalog and custom Microwave products for applications such as:
For the Defense market: Electronic Warfare (EW) systems, Radars, Missiles, UAV, Smart Munition, GPS Immune, Communications, Data Links, HLS and Simulators
For the Commercial market: In-Flight-Connectivity, IFF, Test Equipment, RF and Fiber Optic Communications, Industry, Research Laboratories and Medical Instruments.

## Microwave Product solutions supporting a wide range of applications including:

Broadband Oscillators and Synthesizers ( 0.5 to 18 GHz and beyond)
Fast Indirect Synthesizers with less than 1 microsecond settling time with modulation, Direct Coherent Synthesizers with 40 nanosecond settling time, Digitally Tuned Oscillators (DTOs) Phase Locked Oscillator (PLOs) and Voltage Controlled Oscillators (VCOs).

## Solid State Power Amplifiers (SSPAs)

Up to 1 KW in X and Ku - bands for missiles, airborne Radars and HLS radars, up to 1 KW in VHF, for military and non-military applications, Pulse Power Amplifiers for IFF systems and Low Noise Amplifiers.

# Integrated Microwave Assemblies (IMAs) and Sub-Systems 

Beam Forming Modules<br>A versatile line of complex high-density modules utilizing Surface Mount Technology, for Phase Array Radars.

Transceivers and Receivers.
Superior performance and cost effectiveness. This product line includes both Narrowband and Broadband products, covering 0.5-18 GHz, for various applications such as Direction Finder subsystem for ELINT and ESM airborne systems, Data Links for Missiles, Smart Munition, UAVs, Centric Network Warfare, JDAM/BDI and more.

## Custom IMAs

Integrated Microwave Assemblies built per specific customer's requirements such as: RF Front Ends, Frequency Converters, and DLVAs.

## Control Components (0.1-40 GHz)

Based upon PIN diode and proprietary coupler technology. This product line includes Switches (SPST up to SP26T) for low, medium and high power, Switched Filter Banks, Attenuators, Limiters, Modulators, Phase Shifters, Frequency Translators and I/Q Vector Modulators. All these products, with either digital or analog control.

## ISO 9001:2008 and AS9100 Rev. C

Kratos General Microwave has been registered to ISO 9001:2008 and AS9100 Rev. C. applicable to the design, manufacture and sales of microwave components, super components and sub systems.

## RoHS Compliance

Kratos General Microwave has a policy of continuous environmental improvement and is committed to working closely with its suppliers and customers to achieve this goal.
The RoHS Directive stands for "the restriction of the use of certain hazardous substances in electrical and electronic equipment". Most of Kratos General Microwave's components are available as RoHS compliant, meeting the requirements of the RoHS Directive when indicted RoHS compliant in our literature and on our web site. If your parts require RoHS compliancy, please indicate as RoHS compliant when you place your order.

## Integrated Microwave Assemblies (IMA)

KRATOS General Microwave manufactures both Catalog and Custom Integrated Microwave Assemblies (IMA). This type of multi-function assembly is sometimes identified as a "Supercomponent" or "Microwave Integrated Circuit" with the primary objectives of significantly increasing performance while reducing the size and weight of a system. Applications can range from high environmentally stressed Airborne and Naval Systems to simply size reduction of large Ground Systems and Test Systems.

In addition to designing IMAs which incorporate Microwave Control Components and or Signal Sources, KRATOS General Microwave Engineering has the capability to also include Amplifiers, Filters, Switched Filters, Power Splitters/Couplers, Gain Equalization Circuits depending on individual Customer specification requirements.

KRATOS General Microwave Engineering carefully reviews the specification requirements of each IMA in order to choose the optimum integration technology to provide the Customer with a high performance, high reliability and cost effective solution. These integration technologies can include any one or a combination of the following:

Standard Chip \& Wire Technology (MIC)
Surface Mount Technology (SMT)
Integration of Discrete Control Components
Selection of the appropriate integration technology is typically driven by various factors which can include, Frequency Range, Bandwidth, available volume and number of IMAs required for production.

KRATOS General Microwave has developed many IMAs including Phase \& Amplitude Control Modules for Simulators, Beam Forming Networks for Phased Array Radars, Broadband Up \& Down Converters, Transmit/Receive Modules and Solid State Power Amplifiers operating in the X to Ku Frequency Ranges. Examples of a few of those IMAs have been provided.

## SMT BEAM FORMING NETWORK - FOR PHASED ARRAY RADARS

## FEATURES

- L and IFF Frequency Bands
- SMTTechnology
- Control of Amplitude and Phase

## Custom ${ }^{*}$ IMAs

## RF FRONT ENDS

## FEATURES

- Broadband
- Low Noise Figure
- Wide Dynamic Range

## FEATURES

- Wide Frequency Range
- Airborne Application

FEATURES

- L to $S$ bands
- Multi Channel

- Airborne Application
- Blind Mating

## Custom-IMA

## FREQUENCY CONVERTERS ASSEMBLIES

## FEATURES

- Frequency Range: 6 to 18 GHz
- High Out of Band Rejection
- High Isolation

Twin Down converter

## Custom ${ }^{*}$ IMAs

FEATURES

- Frequency Range: 2 to 18 GHz
- High Out of Band Rejection
- High Isolation

## Custom -IMA

## FREQUENCY CONVERTERS ASSEMBLIES

Down converter

## MILLIMETER WAVE TRANSMIT/RECEIVE MODULES

Millimeter Wave Transmitter Sub Assembly

FEATURES

- Operating within Ka Frequency Band
- High Efficiency transmitter
- Five channel receiver

## TRANSCEIVER FOR DATA-LINKS and SMART MUNITION

KRATOS General Microwave designs and manufactures a variety of customized DATA-LINKS sub-systems, from small, simple, low cost, low power to complex, high-end, high power. Those Data Links are used in various platform and applications such as UAV, mini-UAV, Missiles, Smart/Precision Guided Munition, Network Centric Warfare (NCW) etc. The products combine State Of The Art Microwave technology, mixed signal processing, System On Chip (SoC) devices, high power FPGAs and other Digital technologies.

Kratos General Microwave is offering Data-Links products in two options, based on the customer's preference::

- Hardware only - allowing the customer to incorporate their own IP Firmware / Modem etc.
- Full Data link, including Microwave, Hardware and Firmware.

KRATOS General Microwave has successfully delivered hundreds of Data Links systems to its customers and continues to develop new generations of DATA LINKS with superior capabilities and additional features.

L BAND DATA LINKS

## MAIN FEATURES

- TX Power >100W
- Pulse / Half Duplex Mode
- High Altitude >200Kfeet
- High Capacity
- Ground Stations
- High End

## Moder PA4095 IFF Transmitter

- Military \& Civilian Modes of Operation
- High Power Output: 600 Watt
- Proven Reliability: LD-MOS Based Design
- High MTBF

## APPLICATIONS

The Model PA4095 was designed to be the transmitter module in an IFF system. It is a state-of-the-art configuration which incorporates all of the RF and Control elements listed below:

- RF Source at 1090 MHz
- Driver and Modulator
- Power Amplifier
- High Power PIN Switch
- Control and Monitoring

| PARAMETERS |  |  |

## Dimensions and Outline

Weight (approx.) 1.4Kg. (49.38 Oz) Dimensions in mm (Inches)

- Wide Frequency Range: 0.5 to 18 GHz
- Three simultaneous IF outputs
- AM and FM detectors
- Low Phase Noise
- Modes of Operation: Scan Mode or Search Mode
- Built-in test functions
- Low Power Consumption
- Low cost

## APPLICATION

The Model WBR-0518-MOD Wideband Receiver utilizes cutting edge technology which provides a high performance and cost effective solution. It has been designed for use as a stand alone receiver or it can be used in more complex receiving systems for ELINT and ESM applications.

## Receiver Model WBR-0518-MOD

## DESCRIPTION

The Model WBR-0518-MOD Super Heterodyne Wideband Receiver was designed to be a low cost, high performance, self contained system capable of advanced detection and processing of communication and non-communication signals. This receiver offers all the features required for high data rate reception while maintaining high pulse fidelity for interception of radar signals. It is ideally suited for today's complex environments.

Signals from the antenna are fed to the WBR receiver input. The input stage consists of a high dynamic range front end which includes a preselector. The dual down converter sections use synthesized LO inputs to convert all incoming signals to 1 GHz signal. This 1 GHz signal is then fed to the IF assembly for further conversion, gain control and filtering to provide simultaneous outputs of 160 MHz and 380 MHz . The 1 GHz signal is also provided as a third and separate IF output. In addition, the 1 GHz signal is fed, in parallel, to the demodulator sections which comprise of AM and FM detectors. These can then extract the respective amplitude and frequency information from the modulated 1 GHz IF signal be it CW or narrow pulse widths of 50 nanoseconds.

The WBR internal control assembly configures all of the receiver sub-assemblies and collects their response to generate a global status report. The internal control assembly also includes a communication link with the external Host computer.

The WBR has built in test (BIT) capability which continuously monitors the operation of the receiver. In the event of a malfunction, it will issue a failure indication alert to the main system.

## Receiver Model WBR-0518-MOD

## PERFORMANCE CHARACTERISTICS

|  | PARAMETER | SPECIFICATION |
| :---: | :---: | :---: |
| 1 | Operating Input Frequency, $\min (\mathrm{GHz}$ ) | 0.5 to 18 |
| 2 | Noise Figure, max (dB) | 14 |
| 3 | Sensitivity (dBm) @ 500 MHz and SNR of $\mathbf{1 5 d B}$ | -58 |
| 4 | DCA Range, min (dB) | 0 to 60 |
| 5 | DCA Resolution, min (dB) | 1 |
| 6 | Measurable Pulse Width | 50 ns to CW |
| 7 | Input Signal Modulations | Pulse, AM and FM |
| 8 | Instantaneous Dynamic Range (dB) | 59 |
| 9 | Number of IF outputs | 3 |
| 10 | IF signal \# 1 | Centered at $\mathbf{3 8 0} \mathbf{~ M H z}$ with selectable bandwidths of $\mathbf{5 0}, \mathbf{1 0 0}, \mathbf{2 5 0}, 500 \mathrm{MHz}$ |
| 11 | IF signal \# 2 | Centered at 160 MHz with selectable bandwidths of $\mathbf{1 , 1 0}, \mathbf{2 0}, 50,100 \mathrm{MHz}$ |
| 12 | IF signal \# 3 | Centered at 1 GHz with bandwidth of 500 MHz |
| 13 | Image Rejection, min (dB) | 60 |
| 14 | RF to IF Gain (dB) | 5 to 10 |
| 15 | Input 1dB CP, min (dBm) | +1 |
| 16 | Input / Output Impedance (Ohms) | 50 |
| 17 | Input / Output VSWR, max | 2:1 |
| 18 | Spurious Level, max (dBm) | -55 |
| 19 | Survival Input Power, max (dBm) | +20 |
| 20 | Total Tuning and Settling Speed | Less than 1 ms to center frequency |
| 21 | Tuning Step Size, min (MHz) | 1 |
| 22 | Integrated Phase Error, max. | $0.8{ }^{\circ}$ RMS |

## Receiver Model WBR:0518-MOD

## PERFORMANCE CHARACTERISTICS

|  | PARAMETER | SPECIFICATION |
| :---: | :---: | :---: |
| 23 | Phase Noise Performance (SSB), max ( $\mathrm{dBc} / \mathrm{Hz}$ ) |  |
| 24 | @ 1kHz offset | -85 |
| 25 | @ $10 \mathbf{k H z}$ offset | -90 |
| 26 | @ $\mathbf{1 0 0} \mathbf{~ k H z ~ o f f s e t ~}$ | - 100 |
| 27 | @ 1 MHz offset | -130 |
| 28 | Tuner Frequency Stability | Less than 1ppm/year |
| 29 | Video Signal Outputs | LOG AM and FM Detectors (at 1 GHz, BW: 100 or 500 MHz) |
| 30 | Power Supplies Requirements |  |
| 31 | $5 \mathrm{VDC} \pm 2.5 \%$ | 3.2A max |
| 32 | $-5 \mathrm{VDC} \pm 2.5 \%$ | 0.1A max |
| 33 | $12 \mathrm{VDC} \pm 5 \%$ | 3.6A max |
| 34 | $-12 \mathrm{VDC} \pm 5 \%$ | 0.3A max. |
| 35 | Receiver Controls | Fast Ethernet (100 Base T) |
| 36 | Built In Test (BIT) |  |
| 37 | On line | Runs in the background |
| 38 | Off line | Upon request |
| 39 | Operating Temperature Range, min | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| 40 | Dimensions | $440 \times 220 \times 40 \mathrm{~mm}$ (17.3" ${ }^{\text {c }} 8.66$ " $\times 1.57$ ") |
| 41 | Weight | $5.8 \mathrm{Kg}(13.8 \mathrm{Lb})$ |

## SwitchedFilteč'Banks

## SWITCHED FILTER BANKS

KRATOS General microwave is providing various types of Switched Filters banks. These are customized products designed to meet specific customers requirements. The main features of this product line are:

1. Fast Switching
2. Low Loss
3. Temperature Stability

The following filter technologies are being used by us:

1. Cavity Combline
2. Lumped Elements
3. Printed Filters

The following are samples of switched filter banks supplied by us

## SUB-MINIATURE SWITCHED FILTER BANK

## FEATURES

- Miniature Cavity 9 Channel
- Very Thin unit: 9 mm, 0.3"

## Switched Filter Banks

Model SBF-0518-7-LEM
VARIOUS TECHNOLOGIES IMPLEMENTED IN A SWITCHED FILTER BANK

FEATURES

- Filters Implemented by: Lumped Elements and Printed filters
- No. of Channels: 7
- Frequency range: 0.5 to 18 GHz

## Detector Logarithmic Videó AMoplifier <br> DLVA DL6 Series

To support customers faced with obsolescence and reliability issues of traditional DLVA suppliers, General Microwave has initially designed and supplied Series DL6 DLVA products as Form, Fit and Function replacements.

Presently, General Microwave offers Series DL6 DLVA as COTS catalog products. In addition to catalog models, custom DLVA units with user specific requirements can be offered.

A broad band logarithmic detector has been developed, capable of detecting CW and pulse signals. This broad band Tunnel Diode Detector has a wide dynamic range, high linearity, high sensitivity and high temperature stability. Special drift compensation circuits have been implemented to ensure a low linearity error over temperature.

- Wide Frequency Range: 1 to 18 GHz
- High Dynamic Range: 70 dB
- Fast Rise Time: 25 nSec.
- Airborne Application

## Amplitude Control Module Sêries ACM Specifications

The Series ACM Integrated Microwave Assemblies (IMAs) were developed for use in high performance Simulator and ATE Systems. They provide precise control of signal Amplitude and Pulse Modulation over a high dynamic range with very fine resolution and can cover a Frequency Range of 0.5 to 40 GHz in only three modules.

These IMAs were designed using the optimum construction technology to achieve superior products and ease of manufacturing. These include Surface Mount Technology for the 0.5 to 2 GHz module, Chip \& Wire (MIC) technology for the broad band 2 to 18 GHz module and Integrated Discrete Components for the much lower volume 18 to 40 GHz module.

## OPTION

Similar modules, which allow the control of both Phase and Amplitude, are also available. Consult the Factory for details.

- High Gain
- High Dynamic Range: 95 dB
- High Resolution: 0.15 dB
- Low Harmonics
- Pulse Modulation: 90 dB, 25 nsec
- Phase Control: Option
- Monotonicity: Guaranteed

## SSPA Power Amplifiers

## POWER AMPLIFIERS

KRATOS General Microwave/Eyal offers a broad range of High Power Amplifiers for both Military and Commercial applications extending over the VHF to Ku Band Frequency Range. The KRATOS Engineering staff is available to design new products to individual specifications, or provide more cost effective customization of existing products, to meet specific Customer requirements. Our Power Amplifiers are typically for used in:

1. RADAR
2. ECM and COMJAM
3. Data-Links for UAVs
4. Test Systems
5. Communication and Cellular Based Stations
6. Special applications

The following is a summary of our capabilities and existing Power Amplifier products

## MAIN FEATURES

1. VHF up to Ku bands.
2. Power levels up to 1 Kw , CW or Pulse.
3. Operating in Class A, AB and C.
4. Solid state technology; utilizing transistors such as Bi-Polar, LDMOS and GaAs.
5. Enabling various inputs.
6. Can be integrated as a RF subassembly module, or as 19 " Rack mounted.
7. Control:
a) Remote control optional of RS 232, RS422 or ETHERNET.
b) Control of Output Power by remote setting and ALC (Automatic Level Control).

## PA PROTECTION and MONITORING

Special means and capabilities are implemented to Protect the Power Amplifiers from the following conditions and to monitor them (at the system level):

1. Over Temperature.
2. Forward Power.
3. Reflected Power.
4. Open/Short Load VSWR.

## CUSTOM PA AND SSPA PRODUCTS

Examples of KRATOS General Microwave/Eyal Custom PA and Solid State Power Amplifier (SSPA) Products and listed in the following pages and can be found on pages 57 to 62 . Consult the Factory with your specific requirements

## Solid State <br> Power AMprólifier SSPA

## SOLID STATE POWER AMPLIFIER (SSPA)

The Solid State Power Amplifier (SSPA) product line was designed for use in the most demanding applications, including Airborne, Missile, Radars and Communications. They are also a practical solution for more benign laboratory or field Test Systems. These diverse applications are made possible by the use of today's cutting edge technologies for design and manufacturing of the SSPAs. As a result, these SSPAs provide high performance, reliability and cost effective alternatives to applications currently using Traveling Wave Tube (TWT) Amplifiers. All SSPAs are designed using the Power Summation concept (Fig1) which provides a graceful degradation capability not found in TWTs and critical to mission completion.

The product line supports both X and Ku Band applications with band width up to $10 \%$ and offers peak power outputs up to 400 Watts. Successful SSPA designs have utilized Gallium Arsenide or Gallium Nitride power devices depending upon which was better suited for the application. The flexibility of the SSPA design provides the ability to extend to adjacent frequency bands requiring only a short development time at very low risk.

The RF input to the SSPA (see fig. 2), is pre-amplified and split into several parallel symmetric branches. Each branch includes a power amplifier section (PA). This distributed design of the SSPA results in built in redundancy and graceful degradation of output power should any individual PA section fail. Each branch includes a current sense alarm indication which is monitored and fed to the SSPA controller. The amplified outputs of all the symmetric branches are summed up in a passive combing network which routes the resultant high power to the output of the SSPA.

- X and Ku Bands
- Power Output: up to 400W
- High Reliability
- For Severe Environmental Applications
- Low Life Cycle Cost

Fig. 1: POWER SUMMATION

Fig. 2: SSPA 400W BLOCK DIAGRAM

## SSPA Power Amplifiers

A compact and highly efficient switching Power Supply Unit (PSU) is built into the SSPA. This state-of-the-art PSU design ensures that any contribution of phase noise and spurious signals are significantly reduced at the RF output. The SSPA control section includes a Modulator which switches the DC lines of the individual PA sections On/Off to achieve the required Pulse Width, Pulse Repetition Interval and Duty Cycle. The SSPA Monitoring section includes Built-in-Test capability which receives indications from critical internal subassemblies, including the PA sections, thereby constantly monitoring the condition of the SSPA.

Most all SSPA designs are custom deriving from Customer specifications because of the differing requirements for specific applications such as Airborne Radars and Missile Seekers. There are, however, many applications which can be served by more generic SSPAs as summarized in the below table. They are offered as Special Catalog SSPAs and intended to provide the user with a proven, cost effective solution rather than a new design.

## SSPA ModeISPA $\times 2$ 2-100

- X Band
- Band Width: 9\%
- Output Power: 100W
- Pulse Width: $250 \mu \mathrm{sec}$ max.
- High Reliability

The Model SPA-X2-100 is a Standard Catalog SSPA designed to fulfill various applications including Radar, Communications and Test Systems. It has been designed for optimum operation in the pulse mode and utilizes proven GaAs power devices which provide high performance and reliability at X-Band.

Typical test data are shown below with Fig 1 comparing the command and resultant detected RF pulses and Fig 2 illustrating the minimal droop for a 256 usec pulse at the maximum of 100 Watt RF Power Output.

## SSPA Model SGN-X3-200

Model SGN-X3-200 is part of our Catalog SGN series Solid State Power Amplifiers (SSPA). The SGN SSPA series is based on GaN technology. Utilizing the GaN technology enables us to provide our customers a lower cost SSPA, with high efficiency and higher packaging, while maintaining all of the advantages of the SSPA, such as High Reliability and Power Redundancy.

The SSPA consists of an input section with preamplifier stages and an power amplifier output section. The output section consists of summation of 6 amplifiers. In addition to the microwave section, there is a proprietary designed asynchronous low-noise power supply and pulsemodulator.

The application of this series of GaN based SSPA, is to fulfill various requirements of high reliable products at lower cost. Typical applications of this SSPA are for Radar, Data Links, Communications and Test Systems.

## SSPA Model SGNEx $\times 3-400$

The Model SGN-X3-400 is part of our Catalog SGN series Solid State Power Amplifiers (SSPA). The SGN SSPA series is based on the GaN technology. Utilizing the GaN technology enables us to provide our customers a lower cost SSPA, with high efficiency and higher packaging, while maintaining all of the advantages of the SSPA, such as High Reliability and Power Redundancy.

The application of this series of GaN based SSPA, is to fulfill various requirements of high reliable products at lower cost. Typical applications of this SSPA are for

Radar, Data Links, Communications and Test Systems.

Following please find the basic block diagram of the microwave section. It consists of an input section with preamplifier stages and an power amplifier output section. The output section consists of summation of 12 amplifiers.
In addition to the microwave section, there is a proprietary designed asynchronous low-noise power supply and pulse-modulator.

## SSPA Model SGN-K1-07

Kratos's Ku-band Solid State Power Amplifier (SSPA) is the lightest, most efficient and compact product for embedding into airborne and micro-flyaway SATCOM terminals. The Ku-band SSPA is based on GaN technology to provide high output power efficiency with significant reductions in heat sink and airflow requirements to meet the size, weight and performance requirements for integration into any flyable or mobile SATCOM terminal. The Kuband SSPA outline can be accommodated to meet customer's specific requirements. Antenna interface is based on a WR62 to minimize transmission loss.

- GaN Technology
- Ku Band
- Band Width: 500 MHz
- Output Power: 7W, CW
- High Efficiency

SSPA Model SGN-K1-07

Most of the Solid State Power Amplifiers (SSPA) supplied by General Microwave have been custom designed to meet specific system requirements. These SSPAs have been fully tested and qualified to meet severe environmental requirements. The following examples represent some of the typical applications of General Microwave's SSPA product line:
a) Airborne RADARS
b) Weather RADARS
c) RADARS for Home Land Security (HLS)
d) Seekers for short range missiles
e) Test Equipment

Certified and fully qualified for airborne application.

Certified and fully qualified for missile application.

## Custom SSPA

## SPECIAL SSPAs

In addition to the Catalog SSPAs, we are offering the following SSPAs as special catalog products.

| Model | SPA-X1-400 ${ }^{(1)}$ | SPA-KU1-400 ${ }^{(1)}$ | SPA-KU2-100 ${ }^{(1)}$ |
| :---: | :---: | :---: | :---: |
| Frequency Range (GHz) | 8.5 to 10.9 | 13.5 to 17.0 | 13.5 to 17.0 |
| Bandwidth, max (MHz) | 400 | 500 | 500 |
| Peak Saturated Output Power, min (W) | 400 | 350 | 100 |
| Average Output Power (W) | 100 | 87.5 | 25 |
| Pulse Width ( $\mu \mathrm{s}$ ) | 0.2-60 | 0.5-250 | 0.5-250 |
| Duty Cycle, max (\%) | 25 | 25 | 25 |
| PRF (kHz) | 1-600 | 1-600 | 1-600 |
| Input Supply Voltage (V) | 22 to 60 | 22 to 32 | 22 to 60 |

## Custom - Power Amplifiers

## POWER AMPLIFIER FOR COMMUNICATION

## FEATURES

- Radio Telephone Applications
- Band-Width - One Octave
- Class AB (Pulse and Amplitude Linearity)

FEATURES

- Frequency Range: 1350-2700 MHz
- Output power at P1dB: 45dBm
- Gain: 44 dB
- DC power Consumption: 110W

## Custom - Power Amplifiers

## POWER AMPLIFIER FOR COMJAM

## FEATURES

- Up to 1 kW
- VHF, UHF, L and Cellular frequency bands

## POWER AMPLIFIER FOR COMMUNICATION

## FEATURES

- Frequency Range: $450-530 \mathrm{MHz}$
- Output power at P1dB: 48.5 dBm
- Gain: 40 dB
- DC power Consumption: 80W

## Custom - Power Amplifiers

## POWER AMPLIFIER FOR UAV DATA-LINK

FEATURES

- VHF, UHF, L and S frequency bands
- Option for Integrated Power Supply (MIL-704 and 461)
- Designed For Frequency Hopping
- Digital Modulation Input
- ALC Power Control
- High Efficiency

(1) The reader interested in more information on this subject should consult one or more of the following references: "Microwave Semiconductor Engineering", J.F. White, Van Nostrand Reinhold Company, 1982.
"Microwave Semiconductor Control Devices", K.E. Mortenson, Microwave Journal, May 1964, pp. 49-57.
"Fundamental Limitations in RF Switching and Phase Shifting Using Semiconductor Diodes", M.E. Hines, Proceedings of the IEEE, vgl. 52, pp. 697-708.
"Biasing and Driving Considerations for PIN Diode RF Switches and Modulators", Hewlett-Packard Applications Note 914, Jan. 1967.

The introduction of the PIN diode more than 45 years ago has led to the development of a large family of RF and microwave control components, including switches, attenuators, modulators, and phase shifters that have become essential elements of most modern microwave systems. Today, the types of PIN diodes available to the component designer is quite extensive and permits a choice of electrical characteristics such as junction capacitance, minority carrier lifetime, reverse voltage breakdown, saturation resistance and resistance vs. current law as well as mechanical format when selecting a diode for a particular application. While a complete treatment of the PIN diode will not be presented here, some of the more important relationships in diode characteristics are described below.
The unique property of the PIN diode that makes it particularly suitable for control component use is that, in its useful operating frequency range, it behaves as a current variable resistor in its forward biased state. Depending upon the diode construction, this resistance can vary from as low as a few tenths of an ohm when the diode is fully ON to as high as 10,000 ohms with zero bias current applied. The PIN diode displays this behavior because, unlike P-N junction diodes, a thin layer of Intrinsic material is inserted between heavily doped layers of P and $\mathbf{N}$ material. When DC current flows through the diode, a stored charge is created in the I layer which establishes the conductance of the diode. The charge is in the form of holes and electrons which have a finite recombination time. As long as the period of any time-varying current is sufficiently short compared to this recombination time, there is effectively no modulation of the diode conductance and, ignoring parasitic reactances, the diode behaves as a pure resistor.
If we define a transition frequency $f_{0}$ as

$$
\mathrm{f}_{0}=\frac{1}{2 \pi \mathrm{t}}
$$

Where $t$ is the minority carrier lifetime, then for frequencies significantly below $f_{0}$ the PIN diode will behave as a P-N junction, rectifying the applied a-c signal. For frequencies well above $f_{0}$ the diode will behave as a linear resistor. The range of $t$ varies from as low as 10 nsec to as high as $5 \mu \mathrm{sec}$, and correspondingly $\mathrm{f}_{0}$ varies from about 16 MHz to 32 kHz .

The degree to which the PIN diode will rectify the a-c signal and thereby generate harmonic power depends not only on the minority carrier lifetime but upon the ratio of the a-c current to the applied d-c current. In general, as the applied signal power rises and the operating frequency decreases, diodes with long minority carrier lifetimes and high bias current are required for satisfactory operation. Unfortunately, such diodes exhibit relatively long switching time and low modulation rates.

When one uses a PIN diode in the microwave frequency range, parasitic reactances will have first order effects. The most important of these is the diode junction capacitance which limits the diode impedance in its back biased state. For low frequency diodes in chip format, employing relatively large junction areas, the junction capacitance is of the order of 0.2 to 1.0 pF. At the other extreme, beam lead diodes exhibit the lowest available junction capacity, ranging from 0.02 to 0.08 pF . For high frequency multi-throw switches, beam lead diodes are frequently employed at the common junction because of their small physical size and low junction capacity. Even with a capacitance as low as 0.02 pF , at a frequency of 18 GHz , the diode will have an impedance of only about 450 ohms in its back biased state due to this reactance. In similar manner, the intrinsic diode inductance as well as that of the connecting ribbons have a significant effect upon the frequency related behavior of the PIN diode.
The diode saturation resistance presents a loss mechanism in the RF and microwave circuit. This resistance can vary from a few tenths of an ohm in a chip diode, to as high as 5 ohms in a low-capacity beam lead diode. In general, there is an inverse relationship between diode junction capacity and saturation resistance. Therefore, in high frequency applications, where low capacity is generally required for best isolation and/or impedance match, higher insertion loss generally arises due to the loss attributed to the diodes.
In the sections that follow more detailed discussions are presented of the circuit topologies, design tradeoffs and performance characteristics of GMC's families of control components. GMC's large number of custom designs, which have evolved from these products, have not been included because of space limitations. Consultation with the factory is recommended for such requirements.

## Attenuâtors

General Microwave PIN diode attenuators cover the frequency range from 200 MHz to 40 GHz and are available in numerous configurations to permit the user to optimize system performance. Most designs are available with either analog or digital control, operating over octave or multi-octave bands with high or moderate switching speed characteristics.

## ATTENUATOR TOPOLOGY

GMC PIN diode attenuators are designed with several different topologies, each of which has been selected to optimize certain performance characteristics. A brief discussion of these various topologies is presented below including a treatment of performance trade-offs.

## SHUNT-MOUNTED REFLECTIVE ATTENUATOR

The simplest version of a PIN diode attenuator consists of one or more PIN diodes in shunt with a transmission line as shown in Fig. 1. This design provides a broadband reflective attenuator that can reach very high levels of attenuation, depending upon the number and electrical spacing of the diodes. While it generally has very low insertion loss and can operate at high switching rates, its usefulness is limited by the very large mismatch it presents in the attenuation state.

Fig. 1-Shunt mounted reflective attenuator

## BALANCED ATTENUATOR

By placing identical shunt-mounted reflective attenuators between an appropriately connected pair of 3 dB quadrature hybrid couplers, a balanced attenuator is realized (see Fig. 2). The balanced attenuator has all the simplicity of the shunt-mounted reflective attenuator with the added feature of providing low VSWR under all conditions of attenuation. In addition, power handling is improved by 3 dB due to the power split of the input hybrid. This style of PIN diode attenuator offers simplicity, up to 3 to 1 bandwidth, moderately fast speed, and excellent linearity. Balanced attenuators are available from General Microwave covering the frequency range of 0.5 to 40.0 GHz .

## ARRAY ATTENUATOR

With the addition of terminating diode elements to the shunt-mounted reflective attenuators of Fig. 1, an attenuator can be realized with low VSWR that can operate over an octave band (see Fig. 3). By tapering the diode and transmission line impedance and adding multiple transformer sections it is possible to obtain good VSWR and attenuation characteristics over several octaves.
GMC employs array attenuators in a number of custom designs.

Fig. 3-Array attenuator

## T-PAD AND $\pi$-PAD ATTENUATORS

The broadest frequency coverage available is obtained with some form of T-pad or $\pi$-pad attenuator. These are lumped element circuits which function in the microwave frequency range in essentially the same manner as they do at DC. Attenuation variation is obtained by simultaneously changing the bias current of the series and shunt diodes comprising the pads in a manner that assures constant impedance at all levels. Fig. 4 shows the basic configurations of both circuits. Only the T-pad configuration is used by GMC due to the difficulties in realizing sufficiently low stray reactances and short transmission line lengths in $\pi$-pad circuits for operation at higher microwave frequencies. Models of these attenuators cover the full frequency range from 0.2 to 18.0 GHz with excellent attenuation flatness and moderate switching speed.

## Atteñuators

Fig. 4-Attenuator configurations

## SWITCHED BIT ATTENUATORS

When an attenuator with a fast switching speed and high power handling capacity is required, the only option is to utilize a switched-bit attenuator. This attenuator combines one or more tandem pairs of SP2T switches with a zero loss connection between one pair of outputs and a fixed attenuator inserted in the other (see Fig. 5). In this configuration the PIN diodes are not used as variable resistors, but are switched between their forward and reversed biased states. This allows for much faster switching speed since high speed PIN diodes and drive circuitry can be used. In addition, it offers higher power handling capacity since the RF power is absorbed in the fixed attenuator(s), and not in the PIN diodes.
There are some disadvantages to this approach that may limit its usefulness. First, the minimum practical attenuation step size at microwave frequencies is

Fig. 5-Switched bit attenuator
about 0.5 dB due to interacting VSWR's as the bits are switched. These interactions may lead to a nonmonotonic response as the attenuation is changed in increments of one LSB, i.e., the attenuation level may actually decrease when an increasing attenuation step is called for. Second, because of the RF circuit complexity, the cost of this attenuator is usually higher than other approaches. Finally, the incorporation of high speed switches may lead to excess video leakage.

## PHASE INVARIANT ATTENUATORS

This specialized class of attenuators has the property that the insertion phase variation is minimized as the attenuation level is changed. A unique topology is employed by GMC to obtain this performance which is described in detail in a separate technical paper. ${ }^{(1)}$ In all other respects they perform in a manner similar to the balanced attenuators described above.

## DRIVER CONSIDERATIONS

All attenuators except for the switched bit variety are available with linearizing driver circuits with either analog or digital control inputs. In addition, many attenuators are available without the driver for those who choose to provide their own. Most digital attenuators are available with eight-bit TTL control which, for an attenuator with a nominal attenuation range of 60 dB , will provide a resolution of 0.25 dB . Some attenuators are available with a resolution of as low as 0.05 dB . Except for switched-bit designs, all PIN diode attenuators are analog in nature and thus their resolution is essentially limited by the DAC used in the driver circuit.
The driver circuit includes compensating elements to minimize the variation of attenuator with temperature. It also provides the proper source impedance and switching waveforms to optimize switching speed.

## STROBE/LATCH FEATURE - OPTION 4

It is recommended that when operating the Series 349/H Attenuators with the Strobe/Latch Option -4 feature, the digital control inputs should be in place, with the Latch set to a low "(0)" level, before the Attenuator is powered up.

## MONOTONICITY

In most applications it is imperative that the attenuator displays monotonic behavior as a function of the control input. Non-monotonic performance can occur in switched bit attenuators when interacting VSWR's are not properly compensated, or in digitally controlled analog attenuators when a non-monotonic condition exists in the MSB of the DAC. All GMC's attenuators are monotonic guaranteed.

## HARMONICS AND INTERMODULATION PRODUCTS

All PIN diode control devices (i.e. attenuators, switches and phase shifters) will generate harmonics and intermodulation products to some degree since PIN diodes are non-linear devices. When compared to digital switched-bit designs, analog PIN diode attenuators are more prone to generate spurious signals since the diodes function as current variable resistors and are typically operated at resistance levels where significant RF power is absorbed by the diode.
The levels of harmonic and intermodulation products generated by an attenuator are greatly dependent upon its design, the operating frequency, attenuation setting and input power level. Typical performance for a moderately fast attenuator, i.e., 500 nsec switching speed, follows:

## TYPICAL ATTENUATOR INTERCEPT POINTS

| FREQUENCY | 2nd ORDER <br> INTERCEPT | 3rd ORDER <br> INTERCEPT |
| :---: | :---: | :---: |
| 2.0 GHz | +35 dBm | +30 dBm |
| 8.0 GHz | +40 dBm | +35 dBm |

## POWER HANDLING

The power handling of a PIN diode attenuator is dependent on its topology, biasing levels, and switching speed. The faster the attenuator, the lower the power handling capability. This catalog specifies both the maximum operating and the maximum survival levels. Maximum operating level is defined as that which will cause an out of specification condition. The survival levels are generally dependent on the maximum ratings of the semiconductors in the attenuator. Please consult the factory for special applications requiring higher operational power levels than those listed in this catalog.

## Atteñuators

## PHASE SHIFT vs. ATTENUATION

All attenuators exhibit a variation in phase shift with attenuation level (AM/PM modulation). Fig. 6 shows typical phase shift variation as a function of attenuation for a number of GMC attenuator models. The phase shift is attributable to both the stray reactance of the PIN diodes as well as the lengths of transmission line interconnecting the diodes. While it is possible to minimize the AM/PM by careful design, it is not possible to eliminate it entirely. Where minimum change of phase with attenuation is a critical parameter, the use of GMC's line of Phase Invariant Attenuators described above should be considered.

Attenuators

MODELS D1968B, 1761 \& 3468C

Typical Phase vs. Attenuation \& Frequency

MODEL 3482

## DEFINITION OF PARAMETERS

MEAN ATTENUATION is the average of the maximum and minimum values of the attenuation over the specified frequency range for a given control signal.
ATTENUATION FLATNESS is the variation from the mean attenuation level over the specified frequency range. This is usually a function of the attenuation level, and is expressed in $\pm \mathrm{dB}$.
ATTENUATION ACCURACY is the maximum deviation of the mean attenuation from the programmed attenuation value expressed in dB when measured at + $23 \pm 5^{\circ} \mathrm{C}$.
TOTAL ACCURACY is the sum of all the effects which contribute to the deviation from the programmed attenuation value. It includes the effects of attenuation accuracy, frequency variation and temperature, as shown in Fig. 7

## SWITCHING SPEED ${ }^{(2)}$

The following are the standard definitions of switching speed, as shown in Fig. 8:
Rise Time is the transition time between the $10 \%$ and $90 \%$ points of the square-law detected RF power when the unit is switched from full OFF to full ON.
Fall Time is the transition between the $90 \%$ and $10 \%$ points of the square-law detected RF power when the unit is switched from full ON to full OFF. On Time is the transition time between $50 \%$ of the input control signal to the $90 \%$ point of the square-law detected RF power when the unit is switched from full OFF to full ON.
Off Time is the transition time between $50 \%$ of the input control signal to the $10 \%$ point of the square-law detected RF power when the unit is switched from full ON to full OFF.
Note: Depending on the attenuator topology, there are differences in the behavior of the switching characteristics that may affect system performance. Switching speed is only specified to the $90 \%$ or $10 \%$ points of the detected RF signal, but the time the attenuator takes to reach final attenuation value or switch between different attenuation levels may be significantly longer.

## MODULATION BANDWIDTH

Small Signal Bandwidth: With reference to a modulation frequency of 100 Hz and a modulation depth of $\pm 3 \mathrm{~dB}$ at a quiescent level of -6 dB , the frequency at which the modulation depth decreases by $50 \%$ as measured with a square-law detector.
Large Signal Bandwidth: With reference to a modulation frequency of 100 Hz and a $100 \%$ modulation depth at a quiescent level of -6 dB , the frequency at which the modulation depth decreases by $50 \%$ as measured with a square-law detector.
TEMPERATURE COEFFICIENT is defined as the average rate of change of attenuation over the full operating temperature range of the unit under fixed bias conditions. It is expressed in $\mathrm{dB} /{ }^{\circ} \mathrm{C}$. Note that the attenuator temperature coefficient may vary with both temperature and programmed attenuation level.

Fig. 8-Switching speed
(2) For units without integrated drivers, the specifications apply to conditions when the attenuator is driven by an appropriately shaped switching waveform.

## Pulse Modulator Model F192A

The Model F192A is a high-speed non-reflective PIN diode pulse modulator with integrated driver. Operating over the instantaneous frequency range from 0.2 to 18 GHz , it provides a minimum isolation of 80 dB from 0.5 to 18 GHz , and 70 dB below 0.5 GHz . The RF design consists of an arrangement of shunt and series diodes in a microstrip integrated circuit transmission line as shown in the schematic diagram below.

Model F192A RF Schematic Diagram

The currents required to switch the unit ON or OFF and simultaneously maintain a bilateral 50 -ohm impedance match in both states are provided by the integrated driver, which is controlled by an external logic signal.

## Series 195 Octave-Band PIN Diode-Attenuator/Modulators

## SERIES 195

Series 195 current-controlled attenuator/modulators provide small size with greater than octave-bandwidth performance at low cost. All models except the 1950A* provide a minimum of 60 dB of attenuation with fall times of 20 nsec max, and rise times ranging from 25 nsec for the 1951 and 1952 to 125 nsec max for the 1956 and 1958. The 1950A* provides a minimum of 80 dB of attenuation with a fall time of 50 nsec max and a rise time of 250 nsec max. These characteristics make this series suitable for a wide range of applications including level setting, complex amplitude modulation, pulse modulation and high-speed switching. The eight models in the Series 195 encompass a frequency range from 0.5 to 18 GHz . All models except the 1950A* are capable of extended bandwidth operation, typically 3:1, with only moderate degradation in performance at the band edges.
As shown in figures 1 and 2 below, the RF circuit employed in all models except the Model 1950A* uses two shunt arrays of PIN diodes and two quadrature hybrid couplers. The quadrature hybrids are of a unique GMC microstrip design which are integrated with the diode arrays to yield a minimal package size. The RF circuit employed in the Model 1950A* uses one shunt array of PIN diodes with input and output impedance matching circuits.

## Seriest D195 Octave-Band PIN Diôde Attenuator/Modulators

## SERIES D195

The Series D195 voltage-controlled linearized attenuator/modulators are integrated assemblies consisting of a Series 195 unit and a hybridized driver circuit which provides a nominal transfer function of 10 dB per volt. (See figure 1 below.)

Fig. 1 Series D195, block diagram

All of the Series D195 units except the D1950A* exhibit fall times of 20 nsec max and rise times of $1.5 \mu \mathrm{sec}$ max for attenuation steps of 10 dB or more. For smaller excursions, the fall times can increase to several hundred nsec, while the rise times remain essentially unchanged. In applications where a rapid return to insertion loss from any level of attenuation is required, Option 59 is available. With this option, an external pulse is applied to trigger a high-speed reset circuit, and recovery times of 200 nsec max are obtained. Where use of an external reset pulse as described above is not feasible, an internal reset option (Option 58 ) is available which will automatically reset the unit to insertion loss within 200 nsec for a step of 50 dB or more.
The fall and rise time specifications for the D1950A* are 500 nsec max and $10 \mu \mathrm{sec}$ max, respectively. Options 58 and 59 are not available for this model.

(1) Where use of an Option 59 external reset pulse (see note 2 below) is not feasible, this option is available which will automatically sense the slope and magnitude of the control signal and reset the unit to the insertion loss state within 200 nsec for a step of 50 dB or more.
(2) An external terminal is provided for the user to apply a fast ( 10 nsec max rise time) positive-going 3-volt pulse at least $0.5 \mu \mathrm{sec}$ wide to accelerate the return of the attenuator to the insertion loss state with the simultaneous lowering of the control signal to the zero voltage level. This reset can be accomplished within 200 nsec.
(3) The input impedance of units equipped with Option 59 is a circuit equivalent to approximately 50 pF in series with a parallel combination of 100 pF and 1000 ohms.

Fig. 2-Series D195, power derating factor

## Series "D195 Specifictations

## D196゙ Series Multi-Octave PIN Diode Attenuators

The D196 Series is a family of Non-reflective voltage variable 60 dB PIN Diode Attenuators covering the frequency range from 0.5 GHz to 18 GHz in four overlapping multi-octave bands.
Each model in the Series is equipped with an integrated driver which controls the attenuation level at the rate of $10 \mathrm{~dB} /$ volt.
The RF circuit consists of two wide-band, T-pad attenuator sections connected in tandem. The driver circuit, which consists of a voltage-to-current converter and linearizing network, furnishes the proper series and shunt currents to control the attenuation value at the specified rate while simultaneously maintaining a bilateral match. See figs. 1 and 2.

Fig. 1-Series D196, rf schematic diagram

- Frequency range: $0.5 \mathrm{GHz}-18 \mathrm{GHz}$ in four overlapping bands
- Attenuation range: 60 dB
- Linear control: $10 \mathrm{~dB} /$ volt
- Low insertion loss
- Non-reflective

Attenuator Model D1968B

All units in this series are equipped with integrated drivers

## Specifications

[^3]
## Series D197 Voltage Cờntrolled Phase Invariant Attenuators

The Series D197 voltage controlled PIN diode attenuators offer essentially phase free operation over a wide dynamic range in multi-octave frequency bands between 2 and 18 GHz . The attenuators utilize a unique double balanced arrangement of diodes and quadrature couplers to achieve the phase independent attenuation characteristic. Excellent temperature stability is maintained by employing a self-compensating biasing scheme. See Fig. 1.

## Model ${ }^{3} 250$ A Ultra-Broadband 6 Bit DigitalPIN Diode Attenuator

The Model 3250A digitally programmable attenuator provides excellent performance characteristics over the frequency range of 0.2 to 18 GHz . Attenuation levels up to 60 dB are programmable in increments of 1 dB .
The unit is an integrated assembly of a dual T-pad PIN diode attenuator and a driver consisting of a D/A and an I/V Converter. See figures 1 and 2.
The Model 3250A operates as a bilaterally-matched device at all attenuation levels. It is supplied in a compact rugged package.

- Frequency range: 0.2 to 18 GHz
- Attenuation range: Up to 60 dB
- 6 Bit Binary or BCD programming
- Absorptive
- Guaranteed Monotonicity

## DIMENSIONS AND WEIGHT

# 346C Series Multi-öctave 10 Bit Digital PIN Diode Atten̆uators 

- Frequency range: $0.5 \mathrm{GHz}-18 \mathrm{GHz}$ in four overlapping ranges
- Attenuation range: 60 dB
- Programming: 10-Bit binary
- LSB: 0.06 dB
- Monotonicity: guaranteed

Attenuator Model 3460C

The 346C Series is a family of Non-reflective PIN diode attenuators, each programmable to 60 dB in attenuation steps as low as 0.06 dB , and covering the frequency range from 0.5 GHz to 18 GHz in four overlapping multioctave bands.
Each model in the Series comprises of an integrated assembly of a dual (current-controlled) PIN diode attenuator, and a driver circuit consisting of a D/A converter and a voltage-to-current converter (see Figure 1 below).
The RF circuit consists of two wide-band, T-pad attenuator sections in tandem. The levels of series and shunt currents required to maintain a bilateral match at all attenuation levels are provided by the driver.
This arrangement assures monotonicity over the operating band at all levels of attenuation and for any programmed attenuation step.

(1) The Series 346C attenuators are 10-bit digital attenuators. In order to use this device with a lesser number of bits (lower resolution), the user may simply ground the logic pins for the lowest order unused bits. For example, a Series 346C unit operated as an 8 -bit unit would have Pin 15 and Pin 3 connected to ground. All other parameters remain unchanged.

| 12 | 32 dB (MSB) |
| 13 | $+V$ |
| 14 | -V |
| 15 | 0.06 dB (LSB) |

(1) All unused logic inputs must be grounded.
(2) For normal programming control Pin 1 must be grounded or at logic " 0 ". Application of logic " 1 " to Pin 1 overrides the digital input and sets the unit to insertion loss. For units with complementary programming (Option 2), the application of a logic " 1 " to Pin 1 sets the unit to high isolation ( 60 dB or greater).
(3) Pin 2 is available to (a) monitor the D/A converter output, (b) apply a modulation signal from a current source, or (c) apply an independent analog signal for turn-on, turn-off or vernier attenuation levels. If not used as described in (a), (b) or (c), Pin 2 must be open.
(4) The Series 346C attenuators are 10-bit digital attenuators. In order to use this device with a lesser number of bits (lower resolution), the user may simply ground the logic pins for the lowest order unused bits. For example, a Series 346 C unit operated as an 8 -bit unit would have Pin 15 and Pin 3 connected to ground. All other parameters remain unchanged.

## Serieș 347,8 Bit Digital PhaseInvariant Attenuators

The Series 347 digitally controlled PIN diode attenuators offer essentially phase free operation over a wide dynamic range in multi-octave frequency bands between 2 and 18 GHz . The attenuators utilize a unique double balanced arrangement of diodes and quadrature couplers to achieve the phase independent attenuation characteristic. Excellent temperature stability is maintained by employing a self-compensating biasing scheme. See Fig. 1.

- Low phase shift
- Frequency range: 2-18 GHz
- Non-reflective

## Series 348 and 348H

The Series 348 and 348H Digitally Programmable Attenuators provide greater than octave band performance in small hermetic packages ideally suited for high reliability applications. The Series 348 offers moderate power handling capability ( 100 mW ) at switching speeds less than 500 nsec while the 348 H Series offers 200 nsec switching speed at lower power. Attenuation of all units is 60 dB with monotonic 0.25 dB step resolution.
The attenuator is an integrated assembly of a sealed RF Microwave Integrated Circuit assembly and a sealed hybrid driver. Attenuation is controlled via a miniature 14 pin connector. See Fig. 1.
Although these units are primarily intended for use as digital attenuators, they can also be used as analog (voltage driven) attenuators or as combination analog/ digital attenuators.

## Modêkir 61 Multi-Octave Digitally Contro Miniatûre RiN Diode Attenuator

Model 1761 is a miniaturized, digitally controlled PIN diode attenuator covering the instantaneous frequency range of 2 GHz to 18 GHz . This model, measuring only 1.34 " square and 0.5 " thick, provides a monotonic attenuation range of 60 dB with 7-bit ( 0.5 dB LSB) resolution and 1 microsecond switching speed.
The Model 1761 is an integrated assembly of a dual PIN diode attenuator and a driver circuit consisting of a D/A converter and voltage-to-current converter. The unit is fully temperature compensated. The RF circuit consists of two wide band, T-pad attenuator sections in tandem. The levels of series and shunt currents required to maintain bilateral match at all frequencies is provided by the driver. This arrangement assures monotonicity over the full 2 to 18 GHz operating band at all levels of attenuation and for any programmed attenuation step. The Model 1761 weighs approximately 1.5 oz . It is configured with SMA female RF connectors and a multipin connector for logic and power. The unit is powered by $\pm 12$ to 15 V DC and the logic input is TTL compatible.

## Series 349 and 349H Octave-Band 11 Bit Digital PIN Diode Attenuators

The Series 349 and 349 H programmable attenuators provide greater than octave-band performance and wide programming flexibility in compact rugged packages. Attenuation ranges up to 80 dB are available with attenuation increments as low as 0.03 dB .
Each Series 349 and 349H unit is an integrated assembly of a balanced PIN diode attenuator and a driver circuit consisting of a PROM, a D/A converter and a current-to-voltage converter. See Figure 1. This arrangement provides a high degree of accuracy and repeatability and preserves the inherent monotonicity of the attenuator.

## SERIES 349

The maximum programmable attenuation range in every band except the $8.0-18.0 \mathrm{GHz}$ frequency range is 80 dB . Attenuators limited in range to 64 dB exhibit switching times less than 500 nsec while the 80 dB units switch in less than $2 \mu \mathrm{sec}$.

## SERIES 349H

If even faster switching of 64 dB units is required, GMC offers its Series 349H attenuators. These units switch in less than 300 nsec with essentially the same performance specifications as the 64 dB Series 349 units.
All the attenuators are available with either a strobe/ latch or a non-linear current or voltage controlled attenuation capability. Refer to the Available Options table and the Notes following the Pin Functions table.

Fig. 1-Series 349 and 349H block diagram

- Absorptive
- 64 or 80 dB range
- .03 dB resolution
- Binary or BCD programming
- Guaranteed monotonicity
- Frequency range: 0.75 to 18 GHz

(1) Applicable only to 80 dB versions.
(2) Specifications for the extended frequency ranges are typical.
(3) Except from $16-18 \mathrm{GHz}$ where insertion loss is 4.2 dB max. and VSWR is 2.2.
(4) Flatness specification at 64 dB level is $\pm 0.2 \mathrm{~dB}$ higher than at 60 dB .
(5) The Series 349 attenuators are 11-bit digital attenuators. In order to use this device with a lesser number of bits (lower resolution), the user may simply ground the logic pins for the lowest order unused bits. For example, a Series 349 unit operated as an 8 -bit unit would have Pin 15 , Pin 1 and Pin 2 connected to ground. All other parameters remain unchanged.
(6) Switching speed for analog input is $100 \mu \mathrm{sec}$. typical. With Option G06 it is not greater than with digital input.
(7) For average attenuation of 80 dB the analog voltage is in the range of 4 to 8 V .
(8) For average attenuation of 80 dB the analog voltage is in the range of 6 to 10 V .

## NOTES

1. The Series 349 attenuators are 11-bit digital attenuators. In order to use this device with a lesser number of bits (lower resolution), the user may simply ground the logic pins for the lowest order unused bits. For example, a Series 349 unit operated as an 8-bit unit would have Pin 15, Pin 1 and Pin 2 connected to ground. All other parameters remain unchanged.
2. Normally supplied as an Analog input. Leave pin open if analog input is not used. Optionally available as a strobe latch function for input data.
3. Pin 3 is available to apply a current or voltage to control the attenuator in a non-linear fashion.
4. It is recommended that when operating the Series 349/H Attenuators with the Strobe/Latch Option -4 feature, the digital control inputs should be in place, with the Latch set to a low "(0)" level, before the Attenuator is powered up.

## Switched-Bit Attenuators

## Digitally-Controlled Switched-Bit Attenuators

When broadband, ultra-fast-switching performance is needed, the digitally-controlled switched-bit attenuator is the only solution. It excels in attenuation accuracy and flatness over broad frequency ranges, and its switching speed is equivalent to a high-speed PIN diode switch ( 25 nsec or better). Its only disadvantages are higher insertion loss and higher cost.
As stated earlier, attenuators are designed to match the requirements of specific applications. When the application requires fast switching speed (as in electronic warfare systems, for example), the switched-bit attenuator is the optimum choice (figure 1). It employs one or more pairs of SP2T switches, with a low-loss connection between one pair of outputs, and a fixed attenuator between the other outputs. The diodes are switched between their forward-biased and reverse-biased states, which gives the attenuator higher switching speed..

- 100 Hz to 18 GHz
- Monotonicity Guaranteed
- High Attenuation Range (up to 81 dB )
- High Speed

## Phase Shifters Frequency Translators and I-Q Vector Modulators

General Microwave Corporation has been a leader in the field of microwave PIN diode control components for more than 35 years. The design and manufacture of high performance, broadband phase shifters, frequency translators and I-Q Modulators have made General Microwave the undisputed leader for these devices.
Today's more demanding systems require the ability to control the phase and amplitude of RF/microwave signals with a repeatable, high degree of accuracy. General Microwave intends this section to not only inform you of our most popular products but also to provide insight into theory of operation, calibration and practical applications where they can be utilized.
General Microwave offers a complete line of broadband phase shifters and I-Q modulators which span the frequency range from 0.05 to 24.0 GHz . These devices are available in several different topologies that allow the designer to choose among various performance characteristics that best suit his system needs. This section describes only our standard line of broadband phase shifter and I-Q modulator models. In addition to these, there are numerous special designs, employing a variety of phase shifter circuits, which General Microwave has utilized in custom applications.

## PHASE SHIFTER FUNDAMENTALS

A variable phase shifter can be characterized as a linear two port device which alters the phase of its output signal in response to an external electrical command. (Mechanical phase shifters are not considered here.) Expressing this mathematically, with an input signal $\sin (\omega t)$, the output will be $A(n){ }^{*} \sin [(\omega t)+\Theta(n)]$, where $n$ is the programmed phase and $A(n)$ is the insertion loss. The difference between the input phase and the output phase is the sum of the phase shift due to the propagation through the phase shifter plus the programmed phase shift.
The relative simplicity of the idea that any reactance placed in series or shunt with a transmission line will produce a phase shift has given rise to many different circuits over the years for use as phase shifters at microwave frequencies.
Usually, for high speed applications, the controlling elements have been semiconductor devices such as

PIN, Schottky and varactor diodes, whereas for high power requirements, when slower switching speed can be tolerated, ferrites are frequently employed. The final choice of a phase shifter network and control element will depend on the required bandwidth, insertion loss, switching speed, power handling, accuracy and resolution. In addition, a choice between analog and digital control must also be made.
Analog phase shifters are devices whose phase shift changes continuously as the control input is varied and therefore offer almost unlimited resolution with monotonic performance. The most commonly used semiconductor control devices used in analog microwave phase shifters are varactor diodes, which act as current controlled variable resistors. Schottky diodes and ferrite devices are also used as variable elements in analog phase shifters but the former suffer from limited power handling capability and matching difficulty in broadband networks whereas the latter are generally larger, require more bias power, and are relatively slow compared to semiconductor designs.
Among the more useful topologies for analog phase shifters are the loaded line design using lumped or distributed elements and the reflective design employing quadrature hybrids. One of the variants of the reflective phase shifter is the vector modulator, which in the particular embodiment used by General Microwave shows excellent performance over 3:1 bandwidths. This capability is especially useful in the design of frequency translators ${ }^{(1)}$ and high resolution phase shifters for EW systems as well as in broadband simulators as I-Q modulators, where separate control of the quadrature components of the signal allow for independent adjustment of both phase and amplitude.
Analog phase shifters are readily convertible to digital control by the addition of suitable D/A converters and appropriate linearizing circuits.
(1) Phase shifters can be used to translate the frequency of an RF carrier by subjecting it to a linear time varying phase shift.

## DEFINITION OF PARAMETERS

## Phase Shift:

The difference in phase angle of the existing RF signal at a given frequency and phase shift setting referenced to the exiting signal at the same frequency with the phase shifter set to zero degree phase shift.

## Accuracy:

The maximum deviation in phase shift from the programmed phase shift over the operating frequency range when measured at room temperature.

## Temperature Coefficient:

The average rate of change in phase shift, as referenced to the zero degree phase state, over the full operating temperature range of the unit. Expressed in degrees phase shift/degrees C .

## PM/AM:

The maximum peak-to-peak change in insertion loss of the phase shifter at any phase state over the full $360^{\circ}$ phase range.

## Switching Speed:

The time interval from the $50 \%$ point of the TTL control signal to within $10^{\circ}$ of final phase shift. This applies to a change in either direction between any two phase states which differ by more than $22.5^{\circ}$.

## Carrier Suppression:

When the phase shifter is operated as a frequency translator, the minimum ratio of carrier output power to the translated carrier output power.

## Sideband Suppression:

When the phase shifter is operated as a frequency translator, the minimum ratio of any sideband output power to the translated carrier output power.

## Translation Rate:

When the phase shifter is used as a frequency translator, the translation rate is determined by dividing the clock rate by the number of steps. Number of steps is equal to $2^{n}$ where $n$ equals number of bits.

## TYPICAL PERFORMANCE CHARACTERISTICS

## HARMONICS AND INTERMODULATION PRODUCTS

All PIN diode control devices will generate harmonics and intermodulation products to some degree since PIN diodes are non-linear devices. When compared to digital switched-bit designs, analog PIN diode phase shifters are more prone to generate spurious signals since the diodes function as current-variable resistors and are typically operated at resistance levels where significant RF power is absorbed by the diode.
The levels of harmonic and intermodulation products generated by a phase shifter or I-Q modulator are greatly dependent upon its design, the operating frequency, attenuation setting and input power level. Typical 2nd and 3rd order intercept performance for a moderately fast phase shifter, i.e. 500 nsec switching speed follows:

## TYPICAL INTERCEPT POINTS

| Frequency | 2nd Order <br> Intercept | 3rd Order <br> Intercept |
| :---: | :---: | :---: |
| 2.0 GHz | +35 dBm | +30 dBm |
| $\mathbf{8 . 0 ~ G h z}$ | +40 dBm | +35 dBm |

## PHASE NOISE

The phase shifters and I-Q modulators offered by General Microwave minimize the contribution of phase noise to system performance. This is accomplished by utilizing PIN diodes which are less sensitive to high frequency noise than Schottky diodes, limiting the noise bandwidth in driver control elements and the use of low noise buffer amplifiers to drive the PIN diodes.

## WHAT IS AN IQ VECTOR MODULATOR?

An IQ Vector Modulator is an RF or microwave circuit which has the ability to control both the amplitude and phase of the transmitted signal simultaneously. Any sinusoidal signal can be expressed as a vector having the properties of both amplitude and phase with respect to a reference signal. If a signal is thought of as a vector in a polar coordinate system with coordinates of amplitude and phase, it can also be defined in a rectangular coordinate system with coordinates of "I" and " Q ". The term " IQ " does not represent anything about the intelligence of the design engineer, but rather that the user can control both the "In-Phase" and "Quadrature-Phase" components of the output signal.

## WHAT IS A TYPICAL IQ MODULATOR CIRCUIT?

The circuit typically includes an input power divider which splits the incident signal into two paths, an amplitude and/or phase control element in each path, and an output signal summing circuit. In the simplest embodiment, the input signal is divided into two equal signals with a $90^{\circ}$ phase difference; controlled by a phase invariant bi-phase attenuator in each path; and combined by an in phase power combiner as shown in figure 1.

## WHAT ACTIVE CONTROL COMPONENTS ARE USED IN IQ MODULATORS?

The control components in an IQ vector modulator are circuits that employ PIN diode, Schottky diode or FET devices. The simplest circuit uses a PIN diode attenuator in series with a PIN-diode bi-phase modulator, or a combination of the two devices in a single bi-phase attenuator. This device has the property of providing a continuous function which first attenuates the input signal with no phase shift, then shifts phase $180^{\circ}$ at maximum attenuation, and then decreases attenuation while holding a constant $180^{\circ}$ phase shift. Balanced or double balanced Schottky diode or FET mixers exhibit a similar function, but are limited in dynamic range of attenuation. PIN diode devices usually exhibit higher power handling, lower insertion loss and higher intercept points than Schottkydiode or FET based devices. Schottky diode or FET devices are preferred for modulation rates higher than a few megahertz.

## WHAT ARE SOME OF THE USES OF IQ VECTOR MODULATORS?

- Amplitude and Phase control for RF simulator systems
- Quadrature Amplitude Modulation
- Cancellation of unwanted jamming signals
- Cancellation of crosstalk between co-located communication systems
- Cross-Polarization Cancellation
- Doppler Simulation
- Nulling of antenna reflections in monostatic radar systems
- Complex weights for Phased Array Antennas
- Linear Filter Equalizer

## HOW ARE IQ VECTOR MODULATORS CALIBRATED?

Calibration of the IQ vector modulator for controlled amplitude and phase response is often performed by generating a "look-up" table using a vector network analyzer. To obtain the highest degree of accuracy, the calibration should be performed in-situ. A discussion of calibration techniques is provided on page 58 . When $I Q$ vector modulators are used in a nulling system an algorithm can readily be developed to adjust the values of $I$ and $Q$ in a closed loop fashion to achieve the desired system performance.

## CAN THE I-Q VECTOR MODULATOR BE CUSTOMIZED FOR SPECIAL APPLICATIONS?

General Microwave has customized many variations of the IQ vector modulator for numerous applications ranging from low cost designs to nuclear hardened radar systems. Our sales and engineering staff are available to help you maximize your system performance by incorporating IQ vector modulators to meet challenging system requirements

FIGURE 1
I-Q Vector Modulator Block diagram

## Theory of Operation \& Practical Applications

## I-Q VECTOR MODULATOR- <br> THE IDEAL CONTROL COMPONENT!

Microwave control components are used to vary signal amplitude and phase. Typically, they consist of twoport devices including amplifiers, attenuators, phase shifters, and switches. The I-Q vector modulator is a unique combination of active and passive devices that is, in theory, ideally suited for the simultaneous control of amplitude and phase.

## THEORY OF OPERATION

FIGURE 1
I-Q Vector Modulator Block diagram

The block diagram of the I-Q vector modulator is shown in Figure 1. An RF signal incident on a 3 dB quadrature hybrid is divided into two equal outputs, with a 90 degree phase difference between them. The in-phase or 0 degree channel is designated the I channel and the quadrature or 90 degree channel is designated the Q channel. Each signal passes through a biphase modulator which selects the 0 or 180 degree state for both the I and the Q paths. This defines the quadrant in which the resultant output signal resides (Figure 2). The attenuator in each path then varies the magnitude
of each of the signals, which are combined in phase to yield the resultant vector. This vector will lie anywhere within the bounded area shown in Figure 2. Thus, any signal applied to the I-Q vector modulator can be shifted in phase and adjusted in amplitude by assuming the desired attenuation level $=x$ dB and the desired phase shift $=\Theta$ degrees. The normalized output voltage magnitude is then given by:

$$
R=10^{-(x / 20)}
$$

The attenuation values of the $I$ and $Q$ attenuators are then given by:

$$
I \text { attenuator }(d B)=20 \log (R \cos \Theta)
$$

$$
Q \text { attenuator }(d B)=20 \log (R \sin \Theta)
$$

Fig. 2-I-Q Phase Relationship

To achieve the desired phase shift, bi-phase modulator states must also be selected as shown in Table 1. In this way, the phase and amplitude of the output signal can be varied simultaneously in a controlled fashion.

| TABLE 1 |  |  |
| :---: | :---: | :---: |
| Bi-phase Modulator States <br> I <br> Q | Desired Phase Shift |  |
| $0^{\circ}$ | $0^{\circ}$ | $0^{\circ}-90^{\circ}$ |
| $180^{\circ}$ | $0^{\circ}$ | $90^{\circ}-180^{\circ}$ |
| $180^{\circ}$ | $180^{\circ}$ | $180^{\circ}-270^{\circ}$ |
| $0^{\circ}$ | $180^{\circ}$ | $270^{\circ}-360^{\circ}$ |

The theoretical model presupposes perfect amplitude and phase balance in the two signal paths, and ideal quadrature coupling in the 3 dB hybrid. To the extent that the conditions are not met in practice, the performance of the I-Q vector modulator will be limited.

## PHASE BALANCE

The key element in determining the useful frequency range of the I-Q vector modulator is the 3 dB quadrature hybrid. Its most important characteristic is very low quadrature phase error (such as small deviation from 90 degree phase shift between outputs). To achieve this over a broad frequency range, we employ the Hopffer quadrature hybrid ${ }^{(2)}$, which exhibits extremely wideband quadrature-phase properties (typically greater than 3 to 1 bandwidth with $\pm 2$ degree phase balance).
In addition to using an in-phase Wilkinson combiner (which, with proper design, exhibits excellent phase balance) the transmission-line length for the I and Q paths must also be carefully phase-matched.
(2) S. Hoofer, "A Hybrid Coupler for Microstrip Configuration," IEEE MTT-S International Microwave Symposium Digest, 1979.

## AMPLITUDE BALANCE

The amplitude balance of the I and Q paths is a second source of performance limitation. Unequal power levels in these paths also produce errors in both the amplitude and phase of the transmitted signal. To minimize this source of error, the quadrature-hybrid coupling must be adjusted to provide minimum deviation from the nominal 3 dB across the frequency band. For an ideal hybrid, the amplitude unbalance will be $\pm 0.31 \mathrm{~dB}$ over an octave band. The effect of amplitude and balance error on phase is shown in Figure 3.

FIGURE 3
Phase Error Due to Amplitude Imbalance

## NON-IDEAL BI-PHASE MODULATOR AND ATTENUATOR

Errors in amplitude and phase will occur if the bi-phase modulator deviates from the ideal, eg: changes state from 0 to 180 degrees with constant amplitude or if the attenuator has an associated phase shift as attenuation

## Theöry of Operation \& Practical Applications

iis varied. Not only do these components in practice exhibit such deviations, but their interacting reflections may increase the resultant errors significantly. The arrangement in Figure 4 minimizes the errors. As indicated, the tandem combination of a biphase modulator and attenuator in each path is replaced by a doubly-balanced biphase modulator. The doublybalanced biphase modulator developed by General Microwave ${ }^{(3)}$ has the ability to attenuate a signal by more than 20 dB with constant phase, then change the phase 180 degrees and return to the low-loss state. At insertion loss, it exhibits a maximum phase error of less than $\pm 6$ degrees and an amplitude balance of $\pm 0.5 \mathrm{~dB}$ over a 3 to 1 bandwidth.

FIGURE 4
Series 71/71 Block Diagram

## PRACTICAL APPLICATIONS

## PHASE SHIFTERS

If the doubly-balanced biphase-modulator conditions are adjusted so that the magnitude of the resultant vector remains fixed, the I-Q vector modulator can behave as a constant-amplitude phase shifter. The relationships between the desired phase shift and the I and $Q$ attenuation levels are given by:

$$
\begin{gathered}
|\mathbf{I}|^{2}+|\mathbf{Q}|^{2}=\mathbf{1} \\
\mathbf{I}=\cos \Theta \\
\mathbf{Q}=\sin \Theta
\end{gathered}
$$

where I and $Q$ are normalized voltages.

[^5]The relationship between the I and Q drive circuitry can be generated in either analog or digital fashion. The analog circuit employs a broadband quadrature hybrid to generate the drive signals. In the digital drive circuit, PROMS are used to provide the required relationships between I and Q. See the Selection Guide on page 61 for the General Microwave phase shifter model numbers.

## FREQUENCY TRANSLATORS

A signal-processing technique using a linear timevarying phase shifter is one method of frequency translation. One principal use is in velocity deception for ECM systems by providing false Doppler radar returns.
In a true Doppler radar situation, the reflected signal is translated in frequency in an amount proportional to the radial velocity of the target. As a rule, there are no harmonics or spurious signals accompanying the reflection. However, if the target is using velocitydeception techniques, spurious signals may be present in the radar return because of the non ideal performance of the frequency translator. The presence of these spurious signals will reveal that the Doppler radar is being jammed. Therefore, it is critical for optimum ECM system performance that the frequency translator suppress the carrier, harmonics and all unwanted sidebands to the greatest extent possible. For the linear phase shifter, the principal factors that contribute to imperfect carrier suppression and sideband generation are:

## Symbol

$\pi$ error
This is the deviation from 360 degrees when maximum phase shift is programmed.

## PM/AM error

The amplitude change (AM) is a function of the phase change (PM).
Phase nonlinearity
It is the deviation from linear phase shift vs. time.

## Quantization error

This term is usually negligible for phase resolution greater than 6 bits. It arises in a digital phase shifter, which only approximates linear phase shift with discrete phase steps.

## Flyback time

This arises from the finite time required by the phase shifter to return from 360 to 0 degrees.

## Theory of Operatition \& Practical Applications

In the I-Q modulator, since the network operates as a constant-velocity rotating vector, the 0 and 360 degree phase states are exactly the same, and the $2 \pi$ error and flyback error are eliminated. In addition, the General Microwave Series 77 provides 10 bits of digital phase control (sufficient to eliminate the quantization error), while phase linearity is optimized by the use of PROM correction in the drive circuitry. Finally, the PM/AM error is minimized by using matched doublybalanced biphase modulators, thereby reducing this error essentially to the difference in amplitude of the 3 dB quadrature hybrid output ports. This amplitude imbalance varies with frequency and generates a unique spurious sideband during frequency translation. An additional PROM correction using RF operating frequency information can be employed to reduce this spurious sideband for customer requirements.

FIGURE 5-Typical Carrier and Sideband Suppression General Microwave Model 7728A Frequency Translator

[^6]
## COMPLEX I-Q VECTOR MODULATORS

System requirements often call for a tandem connection of phase shifters and attenuators to provide independent control of magnitude and phase of an RF signal. If tight tolerances are required for the amplitude and phase accuracy, a look-up table is usually incorporated in the system software to calibrate the phase shift and attenuation across the frequency range. This is a tedious job that entails the generation of an extensive amount of error correction data, obtained by alternately varying the phase shifter and attenuator over the dynamic range for each narrow frequency band where optimization is required. The inclusion of an I-Q vector modulator in the system in place of a discrete phase shifter and attenuator offers several distinct advantages. A single RF component replaces two separate units, thus reducing cost and eliminating interacting VSWR. The relationship between the I and Q inputs and the desired amplitude and phase permits a tremendous reduction in the amount of data required for a look-up table. This is because the I and $Q$ inputs are independent variables for the $\mathrm{I}-\mathrm{Q}$ vector modulator, whereas the tandem connection of attenuator and phase shifter exhibit large AM to PM and PM to AM pushing, creating dependency between the amplitude and phase inputs. Depending on the frequency range and accuracy specifications, the RF circuitry of the I-Q vector modulator can be optimized to eliminate the need for a look-up table entirely.
The I-Q Vector Modulator is ideally suited for use in EW Simulators, Adaptive Equalizers or Automatic Test/ Calibration Systems where extremely high accuracy and repeatability are essential.
See the Selection Guide on page 61 for the General Microwave I-Q Vector Modulator model numbers.

## WHAT IS FREQUENCY TRANSLATION?

Translation is shifting the frequency of a signal by a user controlled delta. This frequency delta, also known as Translation Rate, is usually notated by "Fm".
When the user wants to translate the signal by 1 Hz he needs to apply a ramp (counter) that sweeps the phase control of the phase shifter (translator) starting from zero phase shift and ending at $360^{\circ}$. in a cyclic manner.
Each cycle should take exactly 1 second in order to achieve a shift of 1 Hz . Using 10 bit counter, the clock of the counter would be $1 / 1024 \mathrm{~Hz}$. Using only 5 bit counter, the clock of the counter would be $1 / 32 \mathrm{~Hz}$. So using less bits will enable lower clock rates. However, too low number of bits will cause poor sidebands and carrier suppression.

Let us assume that we have a pure sine-wave signal as a carrier at Fc that appears at the output of the phase shifter with a nominal amplitude of 0 dBm .
Now, when introducing an Fm [Hz] translation (covering the $360^{\circ}$ once every $1 / \mathrm{Fm}$ [seconds]) using the 5 Most Significant Bits.
With a perfect phase shifter we expect that the spectrum will look like this:

Ideal Frequency Translation of CW Signal

Ideal FrequencyTranslation

However, with a practical phase shifter the spectrum will look like this:

## Practical Frequency Translation of CW Signal

Where:
Carrier Suppression: The amplitude difference between the translated signal and the original carrier.
Sideband Suppression: The amplitude difference between the translated signal and the strongest sideband (could be at Fc-n*Fm or Fc $\square n^{*} F m$, but usually is the $\mathrm{Fc} \square \mathbf{2}^{*} \mathrm{Fm}$ product).

IL Variation: Reduction of the Translated Carrier amplitude relative to an amplitude at low translation rate (50 kHz)."

Ideal Frequency Translation of a Wide-Band Signal

## Amplitude and Phasecalibration

General Microwave I-Q Vector modulators can be calibrated to provide precision control on both amplitude and phase over their full rated dynamic range. The calibration is performed using a vector network analyzer and a customer generated test program to achieve the utmost in accuracy. The most frequently used algorithm to accomplish this calibration is described herein. This algorithm involves defining a unity circle and then employing an iterative technique to locate precise calibration values.
Many factors contribute to the overall accuracy that is achievable using any calibration routine for the I-Q vector modulator. It is important that the user fully understand the limitations of measurements in calibrating these units at microwave frequencies. For example, it is imperative that the desired calibration accuracy not exceed the accuracy and repeatability of the microwave test equipment. Another factor which must be included in the overall calibration accuracy is the effects of temperature on the I-Q modulator and the test equipment. Given that the user has a thorough understanding of vector network analyzer measurements, the following will be useful for generating a calibration program for a digitally controlled I-Q vector modulator. (Note that an analog controlled unit can be calibrated in the same fashion using the relationship that 000 hex equals zero volts and FFF hex equals ten volts on the I and Q controls.)
1.0 The calibration routine is performed at discrete frequencies in the band of interest. The calibration will be valid over an interval of frequencies centered at the calibration frequency and will be limited by the amplitude and phase errors that occur as frequency is varied. The highest calibration accuracy will occur with minimum frequency interval size. However this
may require an excessive amount of calibration time and data storage. It is recommended that a calibration interval of 100 to 200 MHz be used in the center of the frequency range of the vector modulator and 25 to 50 MHz be used at the band edges. The optimum calibration interval for any user must be determined empirically by insuring that the maximum phase and amplitude error over the frequency calibration interval is within the desired limits.
2.0 Once the calibration interval and the calibration frequency have been chosen, the next step is to define the $I$ and $Q$ axes and the magnitude of the unit circle. For this example, the I axis is defined to be the horizontal axis on the I-Q plane with control word 000 (hex) being equivalent to a vector of approximate magnitude 1.0 at an angle of zero degrees. In the same fashion the $Q$ axis is defined to be the vertical axis on the I-Q plane with control word 000 (hex) equivalent to a vector of approximately magnitude 1.0 at an angle of 90 degrees. Note that for both I and Q, the magnitude zero vector is approximately 7FF (hex) and the magnitude -1.0 vector occurs as FFF (hex). Following this procedure the definition of the I-Q plane is arrived at per the table below:

| TABLE 2 |  |  |
| :---: | :---: | :---: |
| I CONTROL <br> (hex) | Q CONTROL <br> (hex) | APPROX. <br> VECTOR |
| 000 | 7FF | 1.0 ANG 0 |
| FFF | 7FF | 1.0 ANG $180^{\circ}$ |
| 7FF | 000 | 1.0 ANG $90^{\circ}$ |
| 7FF | FFF | 1.0 ANG $270^{\circ}$ |

3.0 The magnitude of the unit circle is determined by finding the maximum insertion loss at the calibration frequency in each of the four states in table 2 above. Since by nature the I-Q plane is a square and not a circle (see figure 6), the maximum insertion loss will occur at one of these four states. Once the maximum insertion loss is determined, the I or $Q$ values of the other three states in table 2 are adjusted to meet the same maximum insertion loss level. Note that only either I or Q should be adjusted to increase insertion loss at any state, not both. The I or Q value that is initially set to 7FF (which is approximately the center of the IQ plane) is not varied during this part of the calibration since the amplitude of the unit circle is not affected by small changes in the control input.
4.0 Having thus defined the unit circle, the next step is to scale the $I$ and $Q$ axes to allow for computation of $I$ and $Q$ values given the desired amplitude and phase. If the I and $Q$ axes were perfectly linear and each consisted of 4096 equal increments (for a 12 bit control), it would be possible to achieve the desired amplitude and phase shift using only the sine and cosine relationships given in figure 6. In order to approach the ideal case, the I and $Q$ values for each of the four states given in table 2 must be scaled if they differ from 000 or FFF (note that the control input at 7FF is not varied in this step). The scaling entails taking the difference between 2048 digital counts (equal to one half of the 12 bit control) and the number of counts required to equalize the insertion loss of each of the four states required for the unit circle derived from step 3.0. For example, assume that the I value at zero degrees ( $\mathrm{l}=000, \mathrm{Q}=7 \mathrm{FF}$ ), is the maximum insertion loss of the four states and that in order to achieve the same level of insertion loss at $180^{\circ}$ (nominal value I=FFF, Q=7FF), I must be lowered by 127 counts such that the new value for $180^{\circ}$ on the unity circle is I=F80, Q=7FF. In this case the I axis for $1<0$ (in the second and third quadrants) is limited to 1921 counts instead of 2048. Thus, when the algorithm is determining the equivalent I value for a desired amplitude and phase occurring in the first or fourth quadrants, the calculated value for $I=R^{*} \cos \Theta$ is multiplied by 2048 and the result subtracted from 2048 ( $1=7 \mathrm{FFF}$, the origin). When, in the same example, this calculation is done for a vector that occurs in the second or third quadrants, the calculated value for $I=$
$\mathrm{R}^{\star} \cos \Theta$ will be multiplied by 1921 and the result added to 2048 (I=7FF) to find the desired I value (reference the I scale at the bottom of figure 6). The scale value will be called SCALE in calculations given in step 5.2. While this scaling is not precise, it is sufficient to enable the algorithm to establish the boundary of the I-Q plane such that any desired amplitude and phase calibration point can be achieved with a minimum of iterations.

FIGURE 6
I-Q Vector Model
5.0 Once the scaling of the axes has been accomplished, the zero degree point on the unity circle is stored and normalized on the vector analyzer. The control word for this point will be approximately $\mathrm{I}=000, \mathrm{Q}=7 \mathrm{FF}$ and all succeeding phase and amplitude values will be referenced to this point. Note that the I control word will differ from 000 if it is not the maximum insertion loss state of the four states listed in table 2. The $Q$ control word will be equal to 7FF. An algorithm to find any desired amplitude and phase with respect to the normalized unit circle zero degree point can be constructed from the following procedure:

## Amplitude and Phase Calibration

5.1 Convert the desired amplitude to a ratio such that the desired amplitude and phase can be expressed as a magnitude ( R ) and phase $(\Theta)$. This is the desired phase and amplitude change with respect to the normalized point obtained in step 5.0.
5.2 Solve for the required values of $I$ and $Q$ and multiply by appropriate scaling factor as outlined in step 4.0. $\mathbf{I}=\left(\mathbf{R}^{\star} \cos \Theta\right)^{*} \operatorname{SCALE}, \mathbf{Q}=\left(\mathbf{R}^{\star} \sin \Theta\right)^{\star}$ SCALE. This process is essentially changing from polar coordinates (amplitude and phase) to rectangular coordinates I and Q.
5.3 Change I-Q modulator control word to the value obtained above and measure the resultant amplitude and phase. Compare the difference between the desired vector (at the calibration frequency) and the measured vector. This difference vector will be adjusted by successive iterations until its amplitude and phase error from the desired value is less than the desired calibration accuracy value. From experience, accuracy values of 0.1 dB and 1 degree are reasonable calibration limits for attenuation levels below 20 dB . However higher accuracy is achievable with careful measurements.
5.4 If the measured vector is within the error limits, store the I-Q value in the calibration table that is being set up. If the error is larger than the limit, calculate the I and Q change that is necessary to reach the desired vector. This is performed by changing both the desired vector and the error vector back into rectangular I-Q coordinates and calculating the difference in I and Q control word required to reach the desired vector. It is recommended that the I-Q steps taken be limited to one half of the calculated value in order to minimize
hunting time. Repeat this process until the desired point is reached within the accuracy limits.
6.0 Complete calibration is usually performed by generating sets of constant amplitude circles on the I-Q plane. Data points can readily be interpolated over the plane and therefore only a limited number of actual calibration points are required. Our experience shows that calibration points taken every 22.5 degrees around a constant amplitude circle with a linear interpolation of $I$ and $Q$ values to find intermediate phase angles is sufficient to achieve high accuracy. Constant amplitude circles should be calibrated every 0.5 dB for the first two dB above insertion loss and 1.0 dB increments beyond that level. Interpolation between constant amplitude circles is also useful in minimizing data collection. For applications that require high speed ( $<1.0 \mu \mathrm{sec}$ ) variations between amplitude and phase states, the entire I-Q plane can be calibrated, interpolated and the results stored for each frequency interval. Where speed is not critical, an interpolation routine can be run in real time and thus the data storage can be minimized. Typical calibrations using this technique should provide amplitude accuracy of $\pm 0.2 \mathrm{~dB}$ and phase accuracy of $\pm 2.0$ degrees over a 10 dB dynamic range for each frequency calibration interval.
Further improvements in accuracy can be obtained by the following:

- Tightening up the error limits at each calibration point
- Reducing the frequency interval
- Maintaining tight control of temperature (less than $\pm 3$ degrees C)

## Series 71, 12 Bit Digital and Series 72iAnalog I-Q VectorModulators

Both Series comprise a family of four solid-state PIN diode I-Q Vector Modulators covering the frequency range from 0.5 to 18 GHz in four bands: 0.5 to $2 \mathrm{GHz}, 2$ to $6 \mathrm{GHz}, 4$ to 12 GHz and 6 to 18 GHz . See Fig. 1 .
All models provide a full $360^{\circ}$ range of phase shift and a minimum of 20 dB attenuation range at any frequency.

- Simultaneous control of amplitude and phase
- 0.5 to 18 GHz in four bands: 0.5 to 2 GHz ; 2 to $6 \mathrm{GHz} ; 4$ to $12 \mathrm{GHz} ; 6$ to 18 GHz
- 12 Bit digitally programmable (Series 71)
- Analog control (Series 72)
- High speed
- Guaranteed monotonicity

Fig. 1-Series 71, 72 Block Diagram

## Seriês 71, 12 Bit Digital and Series 72 Analos I-Q Vector Modulations

## THEORY OF OPERATION

The block diagram of the I-Q Vector Modulator is shown in Figure 1. An RF signal incident on a 3 dB quadrature hybrid is divided into two equal outputs, with a $90^{\circ}$ phase difference between them. The in-phase, or $0^{\circ}$, channel is designated the I channel and the Quadrature, or $90^{\circ}$, channel is designated the Q channel. Each signal passes through a biphase modulator which sets the $0^{\circ}$ or $180^{\circ}$ state and the attenuation level for both the I and Q paths. The outputs of the I and Q path are combined to yield the resultant vector which may fall anywhere within the bounded area shown in Figure 2. Any signal applied to the I-Q Vector Modulator can be shifted in phase and adjusted in amplitude by applying the following relationships:

1. Let the desired attenuation level $=X \mathrm{~dB}$ and the desired phase shift $=\theta^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states).
2. The normalized output voltage magnitude is given by: V =10-(x/20).
3. The values of the $I$ and $Q$ attenuator control inputs are then expressed as:

$$
\mathbf{I}=\mathrm{V} \cos \theta
$$

and

$$
\mathbf{Q}=\mathbf{V} \sin \theta
$$

Figure 3 shows the nominal value of $I$ and $Q$ vs. either digital word (Series 71) or analog voltage (Series 72). Thus, to achieve an attenuation level of 3 dB with a phase offset of $112.5^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states) the values of I and $Q$ can be calculated as follows:

$$
\begin{aligned}
& \mathrm{V}=10^{-(3 / 20)}=0.707 \\
& \mathrm{I}=0.707 \cos \left(112.5^{\circ}\right)=-.027 \\
& \mathrm{Q}=0.707 \sin \left(112.5^{\circ}\right)=+0.65
\end{aligned}
$$

From Figure 3, the control inputs to yield the desired amplitude and phase are approximately:

$$
\begin{array}{cc}
\text { Analog Units (72 Series) } & \text { Digital Units (71 Series) } \\
\hline I=5.78 \text { volts } & 100101000000 \\
Q=2.84 \text { volts } & 010010001011
\end{array}
$$

While these values for I and Q will yield an output signal whose amplitude and phase are close to the nominal values over the entire operating frequency range of the vector modulator, the use of an iterative measurement procedure will determine the $I$ and $Q$ inputs which exactly define the desired parameter at any selected frequency.

## BroadbandleQ Vector Modulator

- Broad Frequency range - 2 to 18 GHz
- Simultaneous control of phase and amplitude
- Digitally programmable - 12 Bits for both I \& Q
- High Speed
- Guaranteed monotonic

IQ Model 7218

The Model 7218 is the latest addition to the family of high performance I.Q. Vector Modulators. Its broadband capability is ideally suited for today's more demanding and complex Electronic Warfare systems

The Model 7218 covers a frequency range of 2 to 18 GHz , is capable of a full 360 Degrees phase control and a minimum of 20 dB amplitude control. Response time is 1 microsecond, maximum. Digital control is accomplished by two 12 bit TTL inputs, for I and Q channels, which provide for high precision calibration of phase and amplitude. Operation is guaranteed to be monotonic.

Fig. 1 - Model 7218 Block Diagram

## Broadband I-Q Vector Modulator

## THEORY OF OPERATION

The block diagram of the I-Q Vector Modulator is shown in Figure 1. An RF signal incident on a 3 dB quadrature hybrid is divided into two equal outputs, with a $90^{\circ}$ phase difference between them. The in-phase, or $0^{\circ}$, channel is designated the I channel and the Quadrature, or $90^{\circ}$, channel is designated the $Q$ channel. Each signal passes through a biphase modulator which sets the $0^{\circ}$ or $180^{\circ}$ state and the attenuation level for both the I and Q paths. The outputs of the I and Q path are combined to yield the resultant vector which may fall anywhere within the bounded area shown in Figure 2. Any signal applied to the I-Q Vector Modulator can be shifted in phase and adjusted in amplitude by applying the following relationships:

1. Let the desired attenuation level $=X d B$ and the desired phase shift $=\theta^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states).
2. The normalized output voltage magnitude is given by: $\mathrm{V}=10^{-(x / 20)}$.
3. The values of the I and $Q$ attenuator control inputs are then expressed as:

$$
\mathrm{I}=\mathrm{V} \cos \theta
$$

and

$$
\mathbf{Q}=\mathbf{V} \sin \theta .
$$

Figure 3 shows the nominal value of $I$ and $Q$ vs. either digital word or analog voltage Thus, to achieve an attenuation level of 3 dB with a phase offset of $112.5^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states) the values of $I$ and $Q$ can be calculated as follows:

$$
\begin{aligned}
& \mathrm{V}=10^{-(3220)}=0.707 \\
& \mathrm{I}=0.707 \cos \left(112.5^{\circ}\right)=-.027 \\
& \mathrm{Q}=0.707 \sin \left(112.5^{\circ}\right)=+0.65
\end{aligned}
$$

From Figure 3, the control inputs to yield the desired amplitude and phase are approximately:

$$
\begin{array}{ll}
\text { Analog Units } & \text { Digital Units } \\
I=5.78 \text { volts } & 100101000000 \\
Q=2.84 \text { volts } & 010010001011
\end{array}
$$

While these values for I and Q will yield an output signal whose amplitude and phase are close to the nominal values over the entire operating frequency range of the vector modulator, the use of an iterative measurement procedure will determine the $I$ and $Q$ inputs which exactly define the desired parameter at any selected frequency.

NOTES:

1. BAND SELECT: Band 1 ( 2 to 6 GHz ) - Apply TTL 0 to Pin 7 or Pin 29

Band 2 ( 6 to 18 GHz ) - Apply TTL 0 to Pin 31 or Pin 33
2. With no band selected, there will be maximum Isolation between J1 and J2

## Seriés 73 , 12 Bit Digital and Series 74 Anal High Dynamic Range I-Q Vector Modulation

- Simultaneous control of amplitude and phase over a 50 dB dynamic range
- 2 to 24 GHz in three bands: 2 to $6 \mathrm{GHz} ; 6$ to $18 \mathrm{GHz} ; 16$ to 24 GHz
- 12 Bit digitally programmable (Series 73)
- Analog control (Series 74)
- High speed
- Guaranteed monotonicity

The new Series 73/74 represents the latest addition to General Microwave's existing line of PIN Diode I.Q. Vector Modulators. Their performance has been enhanced to provide a higher dynamic range of attenuation for today's more demanding system applications.
All models incorporate multiple bi-phase modulator sections to provide in excess of 60 dB attenuation range at any frequency. All models are also capable of a full $360^{\circ}$ range of phase shift. The series covers a frequency range of 2 GHz to 24 GHz in three bands: 2 GHz to $6 \mathrm{GHz}, 6 \mathrm{GHz}$ to 18 GHz , and 16 GHz to 24 GHz . A simplified block diagram is shown in Fig. 1.

## Serries ${ }^{\text {r }} 73 / 74$ Specifications

## THEORY OF OPERATION

The block diagram of the I-Q Vector Modulator is shown in Figure 1. An RF signal incident on a 3 dB quadrature hybrid is divided into two equal outputs, with a $90^{\circ}$ phase difference between them. The inphase, or $0^{\circ}$, channel is designated the I channel and the Quadrature, or $90^{\circ}$, channel is designated the Q channel. Each signal passes through a biphase modulator which sets the $0^{\circ}$ or $180^{\circ}$ state and the attenuation level for both the I and Q paths. The outputs of the I and Q path are combined to yield the resultant vector which may fall anywhere within the bounded area shown in Figure 2. Any signal applied to the I-Q Vector Modulator can be shifted in phase and adjusted in amplitude by applying the following relationships:

1. Let the desired attenuation level $=\mathrm{XdB}$ and the desired phase shift $=\theta^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states).
2. The normalized output voltage magnitude is given by: $\mathrm{V}=10^{-(x / 20)}$.
3. The values of the $I$ and $Q$ attenuator control inputs are then expressed as:

$$
\mathrm{I}=\mathrm{V} \cos \theta
$$

and

$$
\mathbf{Q}=\mathbf{V} \boldsymbol{\operatorname { s i n }} \theta .
$$

Figure 3 shows the nominal value of $I$ and $Q$ vs. either digital word (Series 73) or analog voltage (Series 74). Thus, to achieve an attenuation level of 3 dB with a phase offset of $112.5^{\circ}$ (with respect to 0 dB and $0^{\circ}$ reference states) the values of $I$ and $Q$ can be calculated as follows:

$$
\begin{aligned}
& \mathrm{V}=10^{-(3 / 20)}=0.707 \\
& \mathrm{I}=0.707 \cos \left(112.5^{\circ}\right)=-.027 \\
& \mathrm{Q}=0.707 \sin \left(112.5^{\circ}\right)=+0.65
\end{aligned}
$$

From Figure 3, the control inputs to yield the desired amplitude and phase are approximately:

$$
\begin{array}{cc}
\text { Analog Units (73 Series) } & \text { Digital Units (74 Series) } \\
\begin{array}{l}
I=7.81 \text { volts } \\
Q=1.50 \text { volts }
\end{array} & 110010000000 \\
001010000000
\end{array}
$$

While these values for I and Q will yield an output signal whose amplitude and phase are close to the nominal values over the entire operating frequency range of the vector modulator, the use of an iterative measurement procedure will determine the $I$ and $Q$ inputs which exactly define the desired parameter at any selected frequency.

## Model 7328H High Speed, High Dy̌namic Range I-Q Vector Moodulator

The Model 7328 H represents the latest advancement to General Microwave's comprehensive product line of PIN diode I-Q Vector Modulators. Its response time has been significantly reduced, resulting in an enhanced modulation rate performance of 50 MHz to better serve today's more demanding system applications.
In addition to the high speed, the Model 7328H incorporates multiple bi-phase modulator sections to provide in excess of 60 dB attenuation through 16 GHz , and is capable of a full 360 degrees of phase shift. Thus, the unit will provide high speed and simultaneous control of amplitude and phase over the full frequency range of 6 to 18 GHz . A simplified block diagram is shown in Fig. 1.

## THEORY

The Theory of Operation of the Model 7328H is the same as the Series 73 units. The RF and Driver portions of the IQ Modulator have been modified to enable modulation rates up to 50 MHz .

- High Speed - Modulation Rate of better than 50 MHz
- Wide Frequency Range - 6 to 18 GHz
- Simultaneous control of amplitude and phase over a 60 dB dynamic range
- Digitally Programmable I\&Q - 12 Bit ECL control
- Guaranteed monotonicity

FIG. 1-SERIES 7328H BLOCK DIAGRAM

## Series 77, 10 Bit Digital and Series 78 Ynalog $60^{\circ}$ Phase Shifters \& Frequency Tran'slators

Both Series, 77 and 78, comprise a family of eight solid-state PIN diode phase shifters covering the frequency range from 0.5 to 18 GHz in four bands: 0.5 to $2 \mathrm{GHz}, 2$ to $6 \mathrm{GHz}, 4$ to 12 GHz and 6 to 18 GHz . All models provide a full $360^{\circ}$ range of phase shift and may also be used for frequency translation applications.
Each unit is an integrated assembly of an RF vector modulator and a driver circuit, consisting of a 10-bit D/A converter and a voltage buffer in the Series 77 digital units (see Fig. 1A) and a voltage converter and buffer in the Series 78 analog configuration (see Fig. 1 B).
The phase in the Series 77 is digitally controlled over a full $360^{\circ}$ in $0.35^{\circ}$ discrete steps. The voltage converter in the Series 78 consists of a 8 bit A/D converter followed by D/A converter, and converts a continuous analog input voltage into discrete steps of $1.41^{\circ}$.

Fig. 1A-Series 77, Block Diagram

- 0.5 to 18 GHz in four bands: 0.5 to 2 GHz ; 2 to $6 \mathrm{GHz} ; 4$ to $12 \mathrm{GHz} ; 6$ to 18 GHz
- 10 Bit digitally programmable (Series 77)
- Analog control (Series 78)
- High speed
- Guaranteed monotonicity

Phase Shifter Model 7728A

## Seriés 77/78

## Specifications

## Phase Shift

Phase shift is achieved utilizing the RF vector modulator approach shown in Fig. 2. The 3 dB hybrid coupler divides the RF signal into two quadrature components which are then modulated in proportion to the sine and cosine of the desired phase shift. The signals are then combined in-phase to yield the phase-shifted output.
Excellent phase accuracy and PM/AM performance (see Figs. 4 and 5) are achieved by using linearized double balanced modulators. In their main operating bands, phase accuracy is better than $\pm 10^{\circ}$ up to 10 GHz and $\pm 12^{\circ}$ to 18 GHz . This phase accuracy can be extended to cover the band edges by using a built-in frequency correction circuit. Switching speed is better than 500 nsec.

Fig. 2-RF vector modulator
Frequency Translation (Serrodyning)
Special attention in the design of the units has been paid to those characteristics which affect their performance as frequency translators. These include minimizing PM-to-AM conversion, use of high slew rate drivers, and optimizing phase shift linearity with applied signal. As a result, carrier and sideband suppression levels of over 25 and 20 dB , respectively, are obtained in the main bands. The same carrier and sideband performance can be realized over the full stretch band when the internal frequency correction circuit is employed.
See Fig. 3 for input voltage control requirements for Series 77 and 78 when used as a frequency translator.
On special order, frequency translators can be provided for operation over reduced bandwidths with suppression levels of up to 35 dB . Consult the factory for special requirements.

NOTES:

## BAND SELECTION BY PIN 3 OF J3 LOGIC LEVEL ASSIGNMENT

(1) For Main Band optimized operation, apply logic HIGH to pin 3 or leave it floating.
(2) For Stretch Band operation, apply logic HIGH to pin 3 or leave it floating. While performance is optimized over the Main Band, the reduced performance as stated
in Stretch Band specifications apply to band edges..
(3) For Band Edges optimized operation, apply logic LOW to pin 3.
4) All specifications are met using five or more most significant bits for 0 to 50 kHz translation rates.

For $50-500 \mathrm{kHz}$ translation rates, only the four most significant bits are used.

## Narrow Band Phase Shifters

In addition to the standard wide band Phase Shifters, KRATOS General Microwave is offering Narrow Band Phase Shifters. These units are available both as standard catalog units and as customized units meeting specific customer's requirements. The narrow band units have better performances and lower prices.

| Frequency Range | Model Number | Phase Accuracy | PM/AM | Insertion Loss |
| :---: | :---: | :---: | :---: | :---: |
| 8.0 to 12.4 GHz | $7728-\mathrm{NB}-0812$ | $\pm 6^{\circ}$ (max.) | $\pm 0.6 \mathrm{~dB}$ | 12.0 dB (max.) |
| 12.0 to 14.5 GHz | $7728-\mathrm{NB}-1214$ | $\pm 6^{\circ}$ (max.) | $\pm 0.6 \mathrm{~dB}$ | 12.0 dB (max.) |

## Model 7928A Miniaturiže̛ 8 Bit $360^{\circ}$ Phase Shifter/Frequency Trahslator

The Model 7928A is a miniaturized, hermetically sealed PIN diode phase shifter covering the frequency range from 6 to 18 GHz providing a full $360^{\circ}$ range of variable phase shift. It can also be used to perform frequency translation.
The unit is an integrated assembly of an RF vector modulator and a driver circuit consisting of an 8-bit D/A converter and a voltage buffer. See Figure 1.

## PHASE SHIFT

Phase shifting is achieved utilizing the RF vector modulator approach shown in Figure 2. The 3-dB hybrid coupler divides the RF signal into two quadrature components which are then biased in proportion to the sine and cosine of the desired phase shift. The signals are then combined in-phase to yield desired output.

## ACCURACY

Improved phase accuracy and PM/AM performance are achieved by using double-balanced bi-phase linear amplitude modulators. In the main operating band, overall phase accuracy is better than $12^{\circ}$. The same phase accuracy can be achieved at the band edges by using a built-in frequency correction circuit.
Switching speed is better than 500 nsec .

## FREQUENCY TRANSLATION (SERRODYNING)

In the design of the Model 7928A special attention has been paid to those characteristics which affect its performance as a frequency translator. These include minimizing PM-to-AM conversion, use of high slew rate drivers, and optimizing phase shift linearity with applied signal. As a result, carrier and sideband suppression levels of over 25 and 20 dB , respectively, are obtained in the main band. The same carrier and sideband performance can be realized over the full stretch band when the internal frequency correction circuit is employed. See Fig. 3 for input control requirements.
On special order, frequency translators can be provided for operation over reduced bandwidths with suppression levels of up to 40 dB . Consult the factory for such requirements.

## PHASE SHIFTER SPECIFICATIONS

| FREQUENCY RANGE (GHz) | INSERTION LOSS (Max.) | vSWR <br> (Max.) | ACCURAC ${ }^{(1)}$ (Max.) | PM/AM ${ }^{(1)}$ (Max.) |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{ll} \text { Main Band } & 8.0-18.0 \\ \text { Stretch Band }{ }^{(3)} & 6.0-18.0 \end{array}$ | 12.0 dB | 2.0:1 | $\begin{aligned} & \pm 12^{\circ} \\ & \pm 15^{\circ} \end{aligned}$ | $\begin{gathered} \pm 1.25 \mathrm{~dB} \\ \pm 2.0 \mathrm{~dB} \end{gathered}$ |

FREQUENCY TRANSLATOR SPECIFICATIONS

| TRANSLATION RATE (Min.) | CARRIER ${ }^{(1)}$ SUPPRESSION (Min.) | SIDE BAND ${ }^{(1)}$ SUPPRESSION (Min.) | INSERTION LOSS VARIATION (Max.) with translation rate of: |
| :---: | :---: | :---: | :---: |
| 0 to $500 \mathbf{k H z}^{(2)}$ | ```Main Band: 25 dB Stretch Band (3): 18 dB``` | ```Main Band: 20 dB Stretch Band (3): 15 dB``` | $\begin{gathered} 200 \mathrm{kHz}: \\ 1 \mathrm{~dB} \\ 500 \mathrm{kHz}: \\ 3 \mathrm{~dB} \end{gathered}$ |

(1) When operating as a Phase Shifter outside the Main Band Frequency Range, a TTL Low ( 0 ) applied to the J3 Power/Control Connector Freq. Correction Pin (pin R) will result in Band Edge Frequencies exhibiting enhanced performance characteristics. The resultant Accuracy and PM/AM specifications will be the same as those shown for the Main Band Frequency Range. When using the unit as a Frequency Translator, similar enhanced performance can be achieved for Carrier \& Sideband Suppression.
(2) All specifications are met using only the five most significant bits for translation rates of 0 to 200 kHz . For translation rates of 201 to 500 kHz , only 4 most significant bits are used.
(3) Specifications for the Strech Band are typical.

## Switches

General Microwave switches cover the frequency range from 100 MHz to 40 GHz and are available in various topologies ranging from single-pole single-throw (SPST) to single-pole eight-throw (SP8T) in both reflective and non-reflective configurations, and a Non-reflective SP16T unit.

## SWITCH TOPOLOGY

There are two fundamental methods of connecting PIN diodes to a transmission line to provide a switching function: in series with the transmission line so that RF power is conducted when the PIN diode is forward biased and reflected when reverse biased; or in shunt with the transmission line so that the RF power is conducted when the diode is reverse biased and reflected when forward biased. A simple reflective SPST switch can be designed utilizing one or more PIN diodes in either configuration as shown in Fig. 1.
A multi-throw switch essentially consists of a combination of SPST switches connected to a common junction and biased so that each switch port can be enabled individually. The common junction of the switch must be designed to minimize the resistive
and reactive loading presented by the OFF ports in order to obtain low insertion loss and VSWR for the ON port. There are two basic methods of realizing a multi-throw switch common junction for optimum performance over a broad frequency range. The first employs series mounted PIN diodes connected to the common junction. A path is selected by forward biasing its series diode and simultaneously reverse biasing all the other diodes. This provides the desired low-loss path for the ON port with a minimum of loading from the OFF ports. The second method utilizes shunt mounted PIN diodes located a quarter wavelength from the junction. The diode(s) of the selected ON port is reverse biased while the OFF ports are forward biased to create a short circuit across the transmission line. As a result of the quarter wavelength spacing, the short circuits are transformed to open circuits at the junction. By proper choice of transmission line impedances and minimization of stray reactance it is possible to construct a switch of this type with low insertion loss and VSWR over a three to one bandwidth. The schematic diagrams for both switches are shown in Fig. 2.

## Switches

## ABSORPTIVE SWITCHES

It is often desirable to have a PIN diode switch present a low VSWR in its OFF position as well as in its ON state in order to maintain desired system performance. General Microwave offers a complete line of single and multi-throw absorptive switches which incorporate $50 \Omega$ terminations in each of the output ports. Fig. 3 shows the schematic diagrams of the two versions of absorptive (also known as Non-reflective or terminated) switches employed by GMC. The shunt termination is used in GMC's "all-series" configured absorptive switches which have a suffix ending in " T " or " W ". This style of absorptive switch offers the minimum penalty in insertion loss due to the addition of the terminating elements. The series termination is used in GMC's high speed "series-shunt" configured absorptive switches since it provides the optimum in switching performance.
The common port of the standard absorptive multithrow switches in the GMC catalog will be reflective in the special circumstance when all ports are turned OFF. If there is a need for this port to remain matched under these conditions, this can be realized either by employing an additional port to which an external termination is connected or, in a custom design, by providing automatic connection of an internal termination to the common port.

## PHASE AND AMPLITUDE MATCHING

Switches are available on a custom basis with phase and/or amplitude matching. Matching can be either between ports of a switch, between like ports on different switches, or a combination of the two. The uniformity of broadband catalog switches is quite good and is usually better than $\pm 0.75 \mathrm{~dB}$ and $\pm 15$ degrees over the entire operating frequency of the switch. Please consult the factory for special requirements.

## HARMONIC AND INTERMODULATION PRODUCTS

All PIN diode switches generate harmonics and inter-modulation products since the PIN diodes are fundamentally non-linear devices. The magnitude of these spurious signals is typically small in a switch since the diodes are usually either in their saturated forward biased state or in their reversed biased state. The physics of the PIN diode cause a cut-off frequency phenomena such that the level of harmonics and intermods greatly increase at low frequencies. These levels will vary with the minority carrier lifetime of the diode. Thus, a high speed switch operating below 500 MHz may have a second order intercept point of 35 dBm , while a slow switch operating at 8 GHz will have a second order intercept point of 70 dBm . Typical performance is as follows:

## TYPICAL SWITCH INTERCEPT POINTS

| SWITCH | FREQUENCY | 2nd Order <br> INTERCEPT | 3rd ORDER <br> INTERCEPT |
| :---: | :---: | :---: | :---: |
| HIGH SPEED <br> LOW SPEED | 2.0 GHz | +50 dBm | +40 dBm |
| 2.0 GHz | +65 dBm | +50 dBm |  |

Since these levels vary significantly with frequency, switching speed, and RF topology, please consult the factory for specific needs in this area.

SHUNT TERMINATION

SERIES TERMINATION
Fig. 3-Schematic diagrams of absorptive switches

## VIDEO LEAKAGE

Video leakage refers to the spurious signals present at the RF ports of the switch when it is switched without an RF signal present. These signals arise from the waveforms generated by the switch driver and, in particular, from the leading edge voltage spike required for high speed switching of PIN diodes. When measured in a 50 ohm system, the magnitude of the video leakage can be as much as several volts. The frequency content is concentrated in the band below 200 MHz although measurable levels for high speed switches are observed as high as 6.0 GHz . The magnitude of the out of band video leakage can be reduced significantly by the inclusion of high pass or "video filters" (1) in the switch. The General Microwave E-series switches are specially designed for low in-band video leakage, without sacrificing switching speed.
(1) For switches with internal video filters, specify Option 41, Option 42, or Option 43. These filters reduce the leakage as shown in the following chart.

## POWER HANDLING

The power handling of PIN diode switches is dependent on the RF topology, forward and reverse biasing levels, and speed of the switch. This catalog addresses both the maximum operating power levels and the survival limits of the components. Maximum operating limits are usually set at the power level which will cause the reversed biased diodes to begin conduction and thereby degrade the insertion loss, VSWR, or isolation of the switch. The survival power limits are based on the maximum ratings of the semiconductors in the switch. For special applications, significantly higher operational power levels can be provided, particularly for narrow band requirements. Please consult the factory for specific applications.

* As shown for switches whose VSWR specification from $1-4 \mathrm{GHz}$ is less than 1.7.
No change for switches whose VSWR specification from $1-4 \mathrm{GHz}$ is 1.7 or greater.

## OPTION 55 - EXTENDED FREQUENCIES

When Option 55 is applicable, a switch in our catalog that covers $1-18 \mathrm{GHz}$ can be modified to cover 0.5 to 18 GHz with following specification changes:

1. Specification for insertion loss and isolation from 0.5 to 1.0 GHz is the same as the 1 to 2 GHz specification.
VSWR degrades to 2.0:1.
2. Insertion loss in the 12.4 to 18 GHz band increases by 0.3 dB . Consult factory for cost.

## DEFINITION OF PARAMETERS

INSERTION LOSS is the maximum loss measured in a 50 ohm system when only a single port of the switch is in the ON state.
ISOLATION is the ratio of the power level when the switch port is ON to the power level measured when the switch port is OFF. In a multi-throw switch the isolation is measured with one of the other ports turned ON and terminated in 50 ohms.

VSWR is defined for the input and output ports of the selected ON path. For those switches with a "T", "W" or "HT" suffix, the VSWR is also defined for the OFF state.

## SWITCHING SPEED ${ }^{12}$

Port-To-Port Switching is the interval from the time the RF power level at the off-going port drops to $90 \%$ of its original value to the time the TF power Irvrl in the ongoing port rises to $90 \%$ of its final value. See Fig. 4
(2) For a unit without an integrated driver, the specifications apply to conditions when it is driven by an appropriately shaped switching waveform.

Fig. 4-Port-to-port switching speed definition

Rise Time is measured between the 10\% and $90 \%$ points of the square-law detected RF power when the unit is switched from full OFF to full ON. See Fig. 5.

Fig. 5-Switching speed definition

Fall Time is the time between the $90 \%$ and $10 \%$ points of the square-law detected RF power when the unit is switched from full ON to full OFF.

On Time is measured from the $50 \%$ level of the input control signal to the $90 \%$ point of the square-law detected RF power when the unit is switched from full OFF to full ON.

Off Time is measured from the $50 \%$ level of the input control signal to the $10 \%$ point of the square-law detected RF power when the unit is switched from full ON to full OFF.

In addition to the above definitions, the following information about switching performance may be useful to the system designer.

Switching To Isolation - Although catalog switching speed specifications are usually defined to the 10\% level of detected RF (equivalent to 10 dB isolation), the user of a switch may be more interested in the time the switch requires to reach rated isolation. This latter time is strongly dependent on the topology of the switch. For all-shunt mounted or combination series and shunt mounted topologies, the time to reach final isolation is usually less than twice the fall time. For an all-series topology, the time to reach final isolation may be as much as ten times the fall time.

Switching To Insertion Loss - For multi-throw switches, the ON time depends on whether the switch is being operated in a commutating or single port mode. In the former mode, switching speed is slower than in the latter due to the loading effect at the junction of the port turning OFF. All switching speed measurements at GMC are performed in the commutating mode.

The Model F192A is a high-speed non-reflective PIN diode SPST switch with integrated driver. Operating over the instantaneous frequency range from 0.2 to 18 GHz , it provides a minimum isolation of 80 dB from 0.5 to 18 GHz , and 70 dB below 0.5 GHz . The RF design consists of an arrangement of shunt and series diodes in a microstrip integrated circuit transmission line as shown in the schematic diagram below.

The currents required to switch the unit ON or OFF and simultaneously maintain a bilateral 50 -ohm impedance match in both states are provided by the integrated driver, which is controlled by an external logic signal.

- High speed
- 0.2 to 18 GHz frequency range
- 80 dB isolation
- Non-reflective
- Low VSWR and insertion loss
- Small size, light weight

## Series 91 and 92 Miniature Broadband SPST Switches

```
- Frequency range (Series 91):
    1 to 18 GHz
```

- Frequency range (Series 92):
0.2 to 4 GHz
- Low VSWR and insertion loss
- Up to 80 dB isolation
- Less than 10 nsec rise and fall time
- Miniature size, light weight

Switch Mode F9214A

DRIVERLESS
UNITS

## SERIES 91 AND 92

Series 91 and 92 switches provide high performance characteristics over a multi-octave range. Series 91 models cover the frequency range of 1 to 18 GHz , while Series 92 models cover the range from 0.2 to 4.0 GHz . These miniature switches measure only $0.75 \times 0.69 \times$ 0.38 inches.

Both series use an integrated circuit assembly of up to four PIN diodes mounted in a microstrip transmission line. The circuit configuration is shown below.

Application of a positive current to the bias terminal switches the unit OFF since the diodes are biased to a low resistance value. With zero or negative voltage at the bias terminal, the diodes are biased to high resistances and the unit is switched ON. Maximum rise and fall times are less than 10 nsec.

## SERIES F91 AND F92

The Series F91 and F92 switches are the same as the corresponding Series 91 and 92 models except the units are equipped with integrated drivers, and the dimensions of the units are $0.75 \times 0.75 \times 0.38$ inches. The proper current required to switch the unit ON or OFF is provided by the integral driver which requires +5 and -12 to -15 volt power supplies and is controlled by an external logic signal.

## Modet F9321T SPDT Phase \& Amplitude Matched Switch

## MODEL F9321T

Model F9321T is a low cost high-performance terminated SPDT switch that operates over the full instantaneous bandwidth of 2 to 21 GHz with ON and OFF times of 100 nsec . Design features include an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line.
The Model F9321T has all of the output ports on one side while maintaining Amplitude and Phase matching between all output ports.
The Model F9321T is equipped with an integrated driver that is powered by +5 and -12 volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

- Frequency range: 2 to 21 GHz
- Isolation: $\mathbf{4 5 ~ d B}$
- In-line outputs
- Phase and amplitude matched
- Non-reflective

## Model F9321T SPDT Specificátions

# Series F892 High-Speed Octave-Band SP2T Switches 

- Low Cost
- S, C and X-U band models
- 10 nsec rise and fall times
- Up to 60 dB isolation
- As low as 1.0 dB insertion loss

Switch Model F8922

THESE THREE UNITS
ARE EQUIPPED WITH INTEGRATED DRIVERS

## SERIES F892

Series F892 high speed switches with integrated drivers are low-cost units that have been engineered to meet the need of microwave system designers for fast switching devices in small packages.

## 2 To 18 GHz Frequency Range

Frequency coverage from 2 to 18 GHz is provided by the three models in the Series: Model F8922 (2-4 GHz), Model F8924 (4-8 GHz) and Model F8928 (8-18 GHz ). Each model is capable of extended bandwidth operation, typically $3: 1$, with only moderate degradation in performance at the band edges, as shown in the specifications on page 102.

## Fast Switching Shunt Design

All models are optimally designed, with respect to their size, for low VSWR and insertion loss. As shown in the schematic below, a pure shunt design is used for the most practical realization of fast switching action. Although the use of a pure shunt mode imposes certain bandwidth limitations, frequency coverage in excess of octave bands has been maintained.

The proper currents required to switch ports ON or OFF are provided by the integrated drivers which are controlled by external logic signals.

## High-Speed Octave-Band SP2T Switches

## SP2T Switches Specifications

- Frequency range (Series 91): 1 to 18 GHz
- Frequency range (Series 92): 0.2 to 4 GHz
- Rise and fall times as fast as 10 nsec
- Reflective and Non-reflective models
- Low VSWR and insertion loss
- Miniature size, light weight

9120-55-33
(DRIVERLESS)

MODELS 9120-500 AND 9220-500
These switches provide high-performance characteristics over a multi-octave frequency range. Model 9120-500 covers the frequency range of 1 to 18 GHz ; Model 9220-500 covers the frequency range of 0.2 to 4 GHz . Both models use an integrated circuit assembly of a series-shunt configuration of PIN diodes mounted in a microstrip transmission line as shown below.

Series 91 and 92 schematic diagram

## Port Control

By applying positive current to a bias terminal, the associated port is OFF since the corresponding shunt diodes are biased to a low resistance and the series diode to a high resistance. With negative current at the bias terminal, the converse conditions are established and the port is ON. Since bias terminals are individually available for both ports, the user has the option of any combination of ports ON or OFF.

## MODELS 9120T-500, 9120W-500 AND 9220T-500

These switches are non-reflective versions of the switches described above. They are constructed in the configuration configuration shown below.

When positive current is applied, the port is OFF since the associated series diodes are back-biased to a high resistance. At the same time, the corresponding shunt diode is biased to a low resistance, and the impedance at the port is then effectively that of the 50 ohm resistor in series with the shunt diode. When applying negative current, the converse conditions are established and the port is ON.
Note that when all output ports are OFF, a high VSWR will be present at the common port.

## MODEL 9120AH-500

This switch has the same circuit topology as the 9120-500 except it is equipped with high-speed diodes to achieve rise and fall times of 10 nsec .

## MODEL 9120AHT-500

This switch is similar to the 9120AH-500 except it includes a terminating network as shown below.

## SERIES F91/F92

The Series F91/F92 units are the same as the Series 91/92 units except they are equipped with integrated drivers that are powered by +5 and -12 to -15 V supplies. The proper currents required to switch the ports ON or OFF are provided by the drivers, which are controlled by external control signals. Standard units are wired so that a port is ON with the application of a logic " 0 " control signal.

## Series 91 and 92 Miniatûre Broadband SP2T Switches

## SERIES G91 and G92

Operating from +5 and +15 V power supplies only, the G-series switches provide high performance characteristics at relatively high speeds over multioctave frequency ranges. The series includes low insertion loss and high isolation models in both reflective and non-reflective configurations. Series G91 units cover the frequency range of 1 to 18 GHz ; Series G92 units cover the frequency range of 0.2 to 4 GHz . The design is based on an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line as shown below. The currents required to switch the ports ON or OFF are provided by the integrated driver, which is controlled by external TTL logic signals.

## SERIES G91T/G92T and G91W

These switches are non-reflective versions of the switches described above.

- Frequency range (Series G91): 1 to 18 GHz
- Frequency range (Series G92): 0.2 to 4 GHz
- Reflective and non-reflective models
- Low VSWR and insertion loss
- Up to 60 dB isolation
- Positive DC supplies only
- Miniature size, light weight

## Model 2677 <br> Wide Frequency Band SP2T Switch

## MODEL 2677

Model 2677 is a wide frequency range, Low Cost, high-performance SPDT switch. It operates over the full instantaneous bandwidth of 0.1 to 20 GHz .

The proper currents required to switch the ports ON or OFF are provided by the user.

- Frequency range: 0.1 to 20 GHz
- Isolation: up to 60 dB
- Small Size

PERFORMANCE CHARACTERISTICS

| CHARACTERISTIC | FREQUENCY (GHz) |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | $0.1-4$ | $4-12$ | $12-18$ | $18-20$ |
| MIN. ISOLATION (dB) | 60 | 60 | 45 | 45 |
| MAX. INSERTION LOSS (dB) | 2 | 2 | 3 | 3.8 |
| MAX. VSWR (ON) | 1.8 | 2.2 | 3.0 | 3.5 |

Switching Time* $\qquad$ 500 nsec max.
*Shaped current pulses must be provided by user.

## Power Handling Capability

Without Performance
Degradation $\qquad$ 1 W cw or peak
Survival Power .1 W average, 75 W peak,
(1 $\mu \mathrm{sec}$ max. pulse width)

## Power Supply Requirements

Port ON $\qquad$ $+7.0 \mathrm{~V} \pm 0.5 \mathrm{~V}, 50 \mathrm{~mA}$ max
Port OFF $-1.0 \mathrm{~V} \pm 0.5 \mathrm{~V}, 50 \mathrm{~mA} \max$

## Wide Frequency Band SP2T Switch

## DIMENSIONS AND WEIGHTS

NOTES

1. DIMENS:ZNS IN ( ), ARE IN MI_LIVETERS

MODEL 2677

Wt: 1.7 oz. (47 gr.) approx.

Dimensional Tolerances, unless otherwise indicated: . $\mathrm{XX} \pm .02 ; . \mathrm{XXX} \pm .008$

## Series 91 and 92 Miniature Broadband SP3T Switches

## MODELS 9130-500 AND 9230-500

These switches provide high-performance characteristics over a multi-octave frequency range. The Model 9130-500 covers the 1 to 18 GHz frequency range while the Model 9230-500 covers the 0.2 to 4 GHz range. This description and operation are the same as that for the Models 9120-500 and 9220-500 SP2T switches.

## MODELS 9130T-500, 9130W-500 AND 9230T-500

These switches are non-reflective versions of the switches described above.

MODELS 9130AH-500 AND 9130AHT-500
These switches are the same as the 9120AH-500 and 9120AHT-500 except for the number of ports.

## SERIES F91 AND F92

The Series F91 and F92 switches are the same as the corresponding Series 91 and 92 models, except the units are equipped with integrated drivers.

## SERIES G91 AND G92

These switches are the same as the Series G91 and G92 SP2T switches except for the number of ports.

- Frequency range (Series 91): 1 to 18 GHz
- Frequency range (Series 92): 0.2 to 4 GHz
- Rise and fall times as fast as 10 nsec
- Reflective and Non-reflective models
- Low VSWR and insertion loss
- Isolation: up to 60 dB
- Miniature size, light weight
 9130-500 (DRIVERLESS)

Switch Model
F9130 (WITH INTEGRATED DRIVER)

## Description

SMA female bias/control connectors SMA male RF connectors Inverse control logic; logic "0" for port OFF and logic " 1 " for port ON (Not applicable to Series 91/92) EMI filter solder-type bias/control terminals Internal video filter, common port only Internal video filter, output ports only Internal video filter, all ports Frequcy range 0.5 to 18 GHz . See page 169. SMB male bias/control connectors Guaranteed to meet Environmental Ratings Cond. A, 5 cycles
*Not applicable to Series 92//F92/G92. See Video Filter Options on page 159
DIMENSIONS AND WEIGHT

(1) USED ONLY ON UNITS WITH INTEGRATED DRIVERS
(2) $\square 15 \mathrm{~V}$ FOR G91/G92 SERIES
(3) NOT USED ON DRIVERLESS UNITS EXCEPTWITH OPTION 33

- Frequency range: $\mathbf{2}$ to $\mathbf{2 1} \mathrm{GHz}$
- Isolation: 50 dB
- Phase and amplitude matched
- In-Line Outputs
- Non-reflective
- Decoder (Optional)
- LVDS Interface (Optional)
- RS-422 / RS-485 Interface (Optional)

## MODEL F9341T

Model F9341T is a low cost high-performance terminated SP4T switch that operates over the full instantaneous bandwidth of 2 to 21 GHz with ON and OFF times of 500 nsec . Design features include an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line.
The Model F9341T has all of the output ports on one side while maintaining Amplitude and Phase matching between all output ports.
The Model F9341T is equipped with an integrated driver that is powered by +5 and $\mathbf{- 1 2}$ volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

## Low Cost SP4T'Switch

## MODEL 2578

The Model 2578 is a low cost high-performance terminated SP4T switch that operates over the full instantaneous bandwidth of 6 to 18 GHz with ON and OFF times of 250 nsec . Design features include an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line.
The Model 2578 is equipped with an integrated driver that is powered by +5 and $\mathbf{- 1 2}$ volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

- Frequency range: $\mathbf{6}$ to 18 GHz
- Isolation: up to 55 dB
- Phase and amplitude Matched
- Non-reflective

## Series 91Fand 92 Miniature Broadband SP5T Switches

## MODELS 9150-500 AND 9250-500

These switches provide high-performance characteristics over a multi-octave frequency range. The Model 9150-500 covers the 1 to 18 GHz frequency range while the Model 9250-500 covers the 0.2 to 4 GHz range. This description and operation are the same as that for the Models 9120-500 and 9220-500 SP2T switches.

MODELS 9150T-500, 9150W-500 AND 9250T-500
These switches are non-reflective versions of the switches described above.

## SERIES F91 AND F92

The Series F91 and F92 switches are the same as the corresponding Series 91 and 92 models, except the units are equipped with integrated drivers.

## SERIES G91 AND G92

These switches are the same as the Series G91 and G92 SP2T switches except for the number of ports.

- Frequency range (Series 91): 1 to 18 GHz
- Frequency range (Series 92): 0.2 to 4 GHz
- Reflective and Non-reflective models
- Low VSWR and insertion loss
- Isolation: up to $\mathbf{6 0 ~ d B}$
- Miniature size, light weight

Switch Model F9150 (WITH INTEGRATED DRIVER)

Switch Model 9150-500
(DRIVERLESS)

## Phase \& Amplitude Matched Switch

## MODEL F9361T

Model F9361T is a low cost high-performance terminated SP6T switch that operates over the full instantaneous bandwidth of 2 to 21 GHz with ON and OFF times of 500 nsec. Design features include an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line.
The Model F9361T has all of the output ports on one side while maintaining Amplitude and Phase matching between all output ports.
The Model F9361T is equipped with an integrated driver that is powered by +5 and -12 volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

- Frequency range: 2 to 21 GHz
- Isolation: 55 dB
- Phase and amplitude matched
- Non-reflective
- In-Line Outputs
- Decoder (Optional)
- LVDS Interface (Optional)
- RS-422 / RS-485 Interface (Optional)

## Modelif 9361 T SP6T <br> Specifications

## Series 91 and 92 Miniatưre Broadband SP7T Switches

## MODELS 9170-500 AND 9270-500

These switches provide high-performance characteristics over a multi-octave frequency range. Model 9170-500 covers the 1 to 18 GHz frequency range while the Model 9270-500 covers the 0.2 to 4 GHz range. Their description and operation are the same as that for the Models 9120-500 and 9220-500 SP2T switches.

MODELS 9170T-500, 9170W-500 AND 9270T-500
These switches are non-reflective versions of the switches described above.

## SERIES F91 AND F92

The Series F91 and F92 switches are the same as the corresponding Series 91 and 92 models, except the units are equipped with integrated drivers.

## SERIES G91 AND G92

These switches are the same as the Series G91 and G92 SP2T switches except for the number of ports.

- Frequency range (Series 91): 1 to 18 GHz
- Frequency range (Series 92): 0.2 to 4 GHz
- Reflective and non-reflective models
- Low VSWR and insertion loss
- Isolation: up to 60 dB
- Miniature size, light weight

(3) Not used on driverless units except with option 33

## Models F9180 and F9180W Low-Cost Broadband SP8T Switches

- Frequency range: $\mathbf{1 - 1 8} \mathbf{~ G H z}$
- Reflective and non-reflective models
- High isolation, low insertion loss and VSWR
- Switching time: 250 nsec

Switch Model F9180

The Models F9180 and F9180W SP8T switches operate over a frequency range of 1 to 18 GHz . They are low-cost state-of-the-art, high isolation, low insertion loss units. For the Model F9180, the reflective design, insertion loss varies from 1.5 dB at 1 GHz to 4.4 dB at 18 GHz . The corresponding values for the Model F9180W, the non-reflective design, are 2.0 dB and 4.8 dB , respectively. Isolation varies from 65 dB at 1 GHz to 55 dB at 18 GHz . The VSWR limit for both designs ranges from 1.7 to 2.0 , depending on frequency. These units switch in under 250 nanoseconds. They operate over temperature ranges as wide as $-54^{\circ} \mathrm{C}$ to $+110^{\circ} \mathrm{C}$ and withstand RF power levels as high as 75 watts peak, 1 watt average.
Each model weighs 8.5 ounces and measures $4.65 \times 1.5 \times 0.75{ }^{\prime \prime}$. They are powered by +5 V DC and -12 to -15 V DC (standard) or by $\pm 5 \mathrm{~V}$ DC (Option 11). Individual port TTL logic control and power supply connections are made by means of a DA15P connector.

Switching Time
ON Time $\qquad$ 250 nsec max.
OFF Time $\qquad$ 250 nsec max.

## Power Supply

 Requirements $\qquad$ $+5 \mathrm{~V} \pm 5 \%$ @ 100 mA-12 to $-15 \mathrm{~V} @ 50 \mathrm{~mA}$

## CONTROL CHARACTERISTICS

CONTROL LOGIC
Logic " 0 " ( -0.3 to +0.8 V ) for port ON
Logic "1" (+2.0 to +5.0 V ) for port OFF
CONTROL INPUT IMPEDANCE
0.5 mA sink current, max.
(1) Models prefixed with "W" are non-reflective except a high VSWR will be presented at the common port if all other ports are OFF.

## Models ${ }^{\text {TF }} 9180$ and F9180W Specifications

## 2553 Series Model 2555-B90 SP8T Phase and Amplitude Matched Switch

## MODEL 2553 SERIES

Model 2553 series consists of SP8T-SP12T multi throw switches. In this series, all output ports are in-line and the ports are phase and amplitude matched.
The 2553 series consists of the following multi throw switches:

| TYPE | MODEL NO. |
| :--- | :--- |
| SP8T | $2553-$ B90 |
| SP10T | $2553-$ B39 |
| SP12T | $2553-$ B48 |

The Model 2553 series is equipped with an integrated driver that is powered by +5 and -12 volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

- Frequency range: 1 to 18 GHz
- Phase matched
- Amplitude matched
- All in-line output ports
- Non-reflective

4. Video Leakage Requirements
5. Option G09-Guaranteed to meet Environmental Ratings

## Model PA-2750-CO SP15T Switch Specifications

## SP16TPIN Diode Switch

- Frequency Range: 2-18 GHz
- Non-reflective
- High Isolation, Low Insertion Loss and VSWR
- Switching Speed: 500 nsec

SPECIAL ORDER PRODUCT ORDERING-

Switch Model 1744

General Microwave Corporation's SP16T PIN Diode Switch, Model 1744, covers the 2 to 18 GHz frequency band. The switch exhibits a maximum insertion loss of 6.0 dB and an isolation of 60 dB to 14 GHz and 50 dB to 18 GHz . The switching speed is 500 nsec maximum. This compact unit measures $4.5 \times 4.0$ $x 0.75^{\prime \prime}$. Power supply voltages are +5 V and +15 VDC , and it is controlled by 7-bit TTL binary logic. The switch operates over the temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

Switch Model PA16

## Series PA16

The Series PA16 Non-Reflective SP16T Switches have been designed for distribution of wide-band RF/ Microwave signals. Applications include EW Simulators and Test Systems. All output ports are Phase and Amplitude matched to further minimize Simulator calibration and enhance the fidelity of Test Systems

## ModeliF940 <br> BroadbandTrransfer Switch

## - Frequency range: 0.5 to 18 GHz

- Low VSWR and insertion loss
- Isolation: up to 60 dB
- Small size, light weight

Switch Model F940H

## MODEL F940H

Model F940H is a high-performance broadband transfer switch that operates over the full instantaneous bandwidth of 0.5 to 18 GHz with ON and OFF times of 30 nsec . Design features include an integrated circuit assembly of PIN diodes mounted in a microstrip transmission line as well as a resistive bias line that contributes to the broadband low-loss performance. The circuit configuration of the Model F940H is shown below.

The Model F940H is equipped with an integrated driver that is powered by +5 and -12 volt supplies. The proper currents required to switch the ports ON or OFF are provided by the driver, which is controlled by external logic signals.

## Hermetically Sealed Low Profile Switches Selection Guide

KRATOS General Microwave is offering a broad range of Hermetically Sealed, Low Profile switches. These are high speed, wide frequency range, high performance switches with low insertion loss and high isolation. They vary from SPST through SP6T, higher Multi-Throw switches are available as specials. The standard thickness of these switches is typically about $0.23^{\prime \prime}(6.0 \mathrm{~mm})$. In some cases, we can provide switches of 0.19 " ( 4.9 mm ) too. These switches are meeting sever environmental requirements such as airborne and naval applications.

In addition to the standard configuration as specified in this catalog, they can be supplied with various options such as: Reflective or Non-Reflective (absorptive), low video leakage , various Power Supply Voltages, OverVoltage Protection and in Drop-In configuration.

## Model E9114H Hermetically Sealed Low Profile SPST Switch

The Model E9114H is a hermetically sealed, low cost high speed SPST PIN diode switch with integrated driver. The switch can be used as a drop-in module. The switch operates over the instantaneous frequency range of 1 to 18 GHz .

- Low cost
- Frequency range: 1 to 18 GHz
- High speed: 10 nsec rise fall times
- Typical 80 dB isolation
- Low VSWR and insertion loss
- Low in-band video leakage
- Low profile
- Hermetically sealed
- Can be used as drop-in module

Switch Model E9114

## OPTION (G09) ENVIRONMENTAL RATING

1 Operating Temperature Range - $-54^{\circ} \mathrm{C}$ to $+95^{\circ} \mathrm{C}$.
2 Humidity - MIL-STD-202G, Method 103B, Condition B (96 hours at 95\%).
3 Shock - MIL-STD-202G, Method 213B, Condition A (50G, 11 msec ).
4 Vibration - MIL-STD-202G, Method 204D, Condition B (0.06" double amplitude or 15G,
5 Altitude - MIL-STD-202G, Method 105C, Condition B (50,000 ft.).
6 Temperature Cycling - MIL-STD-202F, Method 107D, Condition A (5 cycles.).

## Models E9130H and E9130HT SP3T Specifications

## DIMENSIONS AND WEIGHT

## Model E9130H/HT

Wt.: 0.70 oz. (20 gr.) approx.

## Moders $=9140 \mathrm{H}$ and E9140HT Hermetically SealedLow Profile SP4T Switches

The Model E9140H is a hermetically sealed, low cost high speed, SP4T PIN diode switch with integrated driver. The switch can be used as a drop-in module. The switch operates over the instantaneous frequency range of 1 to 18 GHz .
The Model E9140HT is a non-reflective version of this switch.

- Low cost
- Frequency range: 1 to 18 GHz
- High Speed: 10 nsec rise fall times
- Reflective and non-reflective models
- Low insertion loss
- Low in-band video leakage
- Hermetically sealed
- Low profile
- Drop-in

## Model FR-2260゙-UK SP6T Specifications

## DIMENSIONS AND WEIGHT

## High Power \& Medium Power Switches

## HIGH POWER \& MEDIUM POWER SWITCHES

KRATOS General Microwave offers wide selection of High and Medium Power PIN Diode Microwave Switches. Current non-reflective and reflective switch designs will support HF, UHF, IFF, L-Band, C-Band and Multi-Band operation with design capabilities up to 18 GHz . These switches are ideal for use in various systems including Communications, IFF, EW, Radar, Test Equipment and other applications demanding high performance, high reliability devices.

The High Power Switches are capable of handling power levels of up to 1 K Watts the Medium Power Switches are capable of handling power levels of 30 Watts.

These High and Medium Power Switch designs are accomplished using PIN Diode shunt and shunt-series topology as required by the individual performance characteristics. Special materials are utilized for proper heat dissipation. A proprietary PIN Diode Driver, incorporating TTL control, has been designed for these switches. That driver is capable of supplying reverse bias of up to -100 Volts and forward current up to 150 mA .

Most of the High and Medium Power Switches are custom designs. Therefore, variations of Frequency Range, Switching Time, Operating Temperature are possible for many of the switches shown. Standard component packaging, utilizing SMA or TNC RF connectors are shown but Carrier drop-in configurations are also available is some models.

## HIGH POWER SWITCHES SERIES HPS9000

KRATOS General Microwave has developed series HPS900 line of High Power SPDT switches for various applications. These switches operate in the IFF and L bands, providing Power handling capability of up to 1 kW in cold switching.

Typically these switches are assembled in a multi-switch assembly. The number of switches in one sub-assembly depends upon the specific architecture of the system. The control and supply voltages to the switch subassembly is supplied via a multi-pin connector.

SPECIAL ORDER PRODUCT

Switch Model HPS-9302
(4 SWITCHES IN A SUB-ASSEMBLY)

## HIGH POWER SWITCHES SERIES HPS 9000

KRATOS General Microwave has developed series HPS900 line of High Power SP3T switches for various applications. These switches operate in the IFF and L bands, providing Power handling capability of up to 1 kW in cold switching.

Typically these switches are assembled in a multi-switch assembly. The number of switches in one sub-assembly depends upon the specific architecture of the system. The control and supply voltages to the switch subassembly is supplied via a multi-pin connector.

## DIMENSIONS AND WEIGHT

## Limiteřs Series LIM

## Limiter Products

KRATOS General Microwave offers PIN diode-based limiters, supporting up to 600 watts of pulsed power. The limiters can be supplied in various configurations: connectorized, drop-in or with field-removable connectors.
The limiters can be supplied as stand alone limiters, or as integrated modules that include the limiter and a control component such as a switch or attenuator as specified in the following:.

## SWITCH LIMITERS

A switch module is available before the limiter, handling up to 25 -watt CW/ 250-watt Peak power.

## LIMITER ATTENUATOR

Provides combined protection and attenuation capabilities (Option).

## LIMITER AMPLIFIER

A limiter and an amplifier module that maintains the required power. Signal is amplified if power is not within the specified range (Option).

## Low Power Limiters

Support $1 \mathrm{GHz}-18 \mathrm{GHz}$, up to 20-Watts Average power and 500 -watt Peak power.

## High Power Limiters

Support 1GHz - 12GHz, up to 60-Watts Average power and 600 -watt Peak power.

## Parameters Trade-off

The main parameters of Limiter specifications are Frequency Band, Input Power and Flat Leakage. Note that there is a trade-off between these parameters.

- Broadband
- Coaxial and Drop-In Modules
- High-Power Ratings

High Power Limiter

Switch Limiter

## Limiters Serfes LIM

## DEFINITION OF PARAMETERS

## Recovery Time:

The time period from the end of a high power pulse to the point where the insertion loss value has returned to within 3 dB of the quiescent loss state.

## Spike Leakage:

After pulsed high power is applied, the limiter will momentarily pass significantly more power than when it is totally saturated. This power rise is seen as a spike on the leading edge of the leakage pulse. The rise time of the high power pulse and the turn-on time of the diode determine the spike's amplitude. The spike is defined by its energy content, i.e., in ergs. The formula for calculating the spike leakage is as follows:

SPIKE LEAKAGE (ERGS) $=t_{\mathrm{s}} \times \mathrm{P}_{\mathrm{s}} \times 10^{7}$
where $t_{s}$ equals spike width at the half-power point in seconds, and $\mathrm{P}_{\mathrm{s}}$ equals maximum spike amplitude in watts.

## Power Handling:

There are two important things to consider when defining the power handling required of a limiter. Two important considerations for defining the required power handling of a limiter are:

- Peak Pulsed Power: for narrow pulses, equated to an equivalent CW power by multiplying the Peak Power by the Duty Cycle. For pulses exceeding 10 microseconds, Peak Power is considered CW
- Source VSWR: When is it fully turned on, the Limiter short circuits across the transmission line, and $90 \%$ incident power is reflected back towards the source
Any mismatch at the source reflects power back toward the limiter, resulting in standing waves. In a correct limiter-source phase relationship, the maximum current point occurs at the input diode, causing the diode to dissipate a greater level of power than incident power.

For a source VSWR of up to 2.0:1, an approximate maximum effective power can be achieved by multiplying the source VSWR by the incident power.
The following formula applies for source VSWRs over 2.0:1:
$\mathrm{PA}=\frac{\mathrm{Ps}}{\left[1 \pm\left(\mathrm{PF}_{\mathrm{L}}{ }^{*} \mathrm{PF}_{\mathrm{s}}\right)\right]^{2}}$
where:

- PA = actual power
- PS = source power
- PFL = load (limiter) power factor 0.96 typical,
- PFS = source power factor.

## CONSIDERATIONS IN USING LIMITERS

- The difference between the flat leakage and the 0.1 dB compression point is typically between 10 and 13 dBm , but may vary according to limiter type
- Noise of 10 dBm may be generated following the start of limiter compression. However, limiters can and usually do exhibit signs of limiter compression at 0 dBm
- Limiters dissipate approximately $8 \%$ of incident power as heat. Therefore, all limiters should be attached to a heatsink whose temperature does not exceed the maximum rated ambient temperature
- Limiters are inherently broadband components. Band limitation results from DC return are required by some limiter designs. Limiters with bandwidths of up to 10:1 are relatively simple, while those with bandwidths exceeding 10: 1 are progressively more complex and costly.
CAUTION! Limiters are NOT bilateral components! They have a defined input and output. Backwards installation will damage the component.

## ATTENUATORS: CURRENT, DIGITAL \& VOLTAGE CONTROLLED

General Microwave wideband millimeter-wave attenuators are available in three configurations.
Model 1959 is current-controlled, while the Model D1959, which incorporates a hybrid driver, is voltage-controlled with a linearized transfer function of 10 dB per volt.
The digitally-controlled Model 3499 provides 0.03 dB resolution (11 bits) and switching speed of less than 500 nsec.
Each of the three models operates over the full frequency range from $18-40 \mathrm{GHz}$ with a dynamic attenuation range of 50 dB .
See Page 331.

## PHASE SHIFTERS

Model 7929 is a MMW Phase Shifter with phase control of $360^{\circ}$, over the entire frequency range of 10 to 40 GHz .
See page 336

## SWITCHES: SPST, SP2T \& SP4T

General Microwave millimeter wave switches are available in SPST and SP2T models in a variety of topologies and configurations, e.g., with currentcontrolled switching, or with integrated TTL compatible voltage drivers, and in both low insertion loss and high isolation models.
All switch models in the series operate over the frequency range from $18-40 \mathrm{GHz}$; each is capable of handling cw or peak powers up to 1 W without performance degradation, and features rise and fall times of less than 10 nsec
See Page 340.

## QUADRATURE COUPLER

The Model 7050 3-dB Quadrature Coupler is a 4-port single-section Hoppfer coupler which operates over the frequency range from 18-40 GHz. It features low insertion loss, high isolation, and excellent amplitude and phase balance.
See Page 344.
CUSTOM IMA PRODUCTS: See Page 343.

## Models 1959, D1959 MFilt'meter Wave PIN Diode Attenuator/Modulator

## - Absorptive

- Current or voltage controlled
- 18 to 40 GHz frequency range
- High performance MIC quadrature hybrid design
- High speed

Attenuator Model D1959 (WITH INTEGRATED DRIVER)

## MODEL 1959

The Model 1959 is a current-controlled attenuator/ modulator that provides a minimum of 50 dB of attenuation over the frequency range of 18 to 40 GHz .
As shown in figure 1 below, the RF circuit uses two shunt arrays of PIN diodes and two quadrature hybrid couplers. The quadrature hybrids are of a unique GMC microstrip design which are integrated with the diode arrays to yield a minimal package size.

## MODEL D1959

The Model D1959 voltage-controlled linearized attenuator/modulator is an integrated assembly of a Model 1959 and a hybridized driver circuit which provides a nominal transfer function of 10 dB per volt. (See figure 2 below.)

Fig. 1-Model 1959, RF schematic diagram

Attenuator Model 3499 (WITH INTEGRATED DRIVER)

The Model 3499 Millimeter Wave Digitally Controlled Attenuator provides greater than octave-band performance and wide programming flexibility in a compact rugged package.
The Model 3499 is an integrated assembly of a balanced PIN diode attenuator and a driver circuit consisting of a PROM, a D/A converter and a current-to-voltage converter, as shown in Figure 1. This arrangement provides a high degree of accuracy and repeatability and also preserves the inherent monotonicity of the attenuator.
The Model 3499 offers a 50 dB attenuation range, 0.03 dB resolution and switching speed of no more than 500 nanoseconds. It is available with either a strobe/latch or a non-linear current or voltage controlled attenuation capability.

Fig. 1 - Model 3499 block diagram

## Mode 3499 <br> Specifications

## Mớé 3499 Specifications

## DIMENSIONS AND WEIGHTS

## ACCESSORY FURNISHED

Mating power/logic connector

## AVAILABLE OPTIONS

Option No. Description
2 Complementary programming (logic " 0 " is Bit ON)
4 Strobe latch for data input. Attenuator responds to data input when logic " 0 " is applied, Attenuator latched to data input when logic " 1 " is applied.
7 Two type K male RF connectors female (J2) RF connector Guaranteed to meet Environmental Ratings
G12
RoHS Compliant

## NOTES:

1. The Model 3499 attenuator is an 11-bit digital attenuator. In order to use this device with a lesser number of bits (lower resolution), the user may simply ground the logic pins for the lowest order unused bits. For example, when operated as an 8 -bit unit, the Model 3499 would have Pin 15, Pin 1 and Pin 2 connected to ground. All other parameters remain unchanged.
2. Normally supplied as an Analog input. Optionally available as a strobe latch function for input data.
3. Pin 3 is available to apply a current or voltage to control the attenuator in a non-linear fashion. leave pin as open circuit if not used.

## Model 7929 MM Wave $360^{\circ}$ Phase Shifter

The Model 7929 is a MMW PIN diode phase shifter covering a frequency range from 18 to 40 GHz providing a full $360 \square$ range of variable phase shift.

## PHASE SHIFT

Phase shift is achieved by utilizing the RF vector modulator approach shown in Figure 2. The 3-dB hybrid coupler divides the RF signal into two quadrature components which are then biased in proportion to the sine and cosine of the desired phase shift. The signals are then combined in-phase to yield desired output.

## ACCURACY

Improved phase accuracy and PM/AM performance are achieved by using double-balanced bi-phase linear amplitude modulators. In the operating band, overall phase accuracy is better than $15^{\circ}$. Switching speed is better than 500 nsec.

- 18 to 40 GHz
- $360^{\circ}$ Range
-0.35 ${ }^{\circ}$ Incremental Resolution
- High Speed
- Digitally Programmable (10 Bits)
- Guaranteed Monotonicity
- Hermetically Sealed

## Narrow Band Phase Shifters

In addition to the standard wide band Phase Shifters, KRATOS General Microwave is offering Narrow Band Phase Shifters. These units are available both as standard catalog units and as customized units meeting specific customer's requirements. The narrow band units have better performances and lower prices.

## SERIES 90

Series 90 switches provide high performance characteristics over the frequency range of 18 to 40 GHz . These miniature switches measure only .75" x .95" x .42".
The series uses an integrated circuit assembly of up to four PIN diodes mounted in a microstrip transmission line. The circuit configuration is shown in Fig. 1, below. Application of a positive current to the bias terminal switches the unit OFF since the diodes are biased to a low resistance value. With zero or negative voltage at the bias terminal, the diodes are biased to a high resistance and the unit is switched ON.

## SERIES F90

The Series F90 switches are the same as the corresponding Series 90 models except the units are equipped with integrated drivers as shown in Fig. 2.
The proper current required to switch the unit ON or OFF is provided by the integral driver which is controlled by an external logic signal. Maximum rise and fall times are less than 10 nsec .

Fig. 1-Series 90 SPST schematic diagram.

Fig. 2-Series F90 SPST schematic diagram.

- 18 to 40 GHz frequency range
- Low VSWR and insertion loss
- Up to 75 dB isolation

Control Logic $\qquad$ Logic "0" ( -0.3 to +0.8 V ) for switch ON and Logic "1" (+2.0 to +5.0V) for switch OFF.

## ENVIRONMENTAL RATINGS AND AVAILABLE OPTIONS

See page 350
(1) Models prefixed with "F" are equipped with integrated TTL-compatible drivers; models without the "F" prefix are current-controlled units and are furnished without drivers.
(2) For driverless units, shaped current pulses must be provided by user.

Dimensional Tolerances, unless otherwise indicated: . $\mathrm{XX} \pm .02 ; . \mathrm{XXX} \pm .008$

## REFLECTIVE SP2T SWITCHES

Series 90 SP2T switches use an integrated assembly of PIN diodes mounted in a microstrip transmission line in a series-shunt arrangement as shown in Figure 1.
When applying positive current (by the driver), the associated port is OFF since the corresponding shunt diodes are biased to a low resistance and the series diode to a high resistance. With negative current at the bias terminal converse conditions are established and the port is ON. All models are supplied with integrated drivers. Standard units are supplied with logic that turns a port ON with the application of a logic " 0 " control signal. Maximum rise and fall times are less than 10 nsec.

- 18 to 40 GHz frequency range
- Rise and fall times less than 10 nsec
- Low VSWR and insertion loss
- Up to 65 dB isolation

Switch Model F9021 (WITH INTEGRATED DRIVER)

## Model 7050 Millimeter Wave 3 dB Quadrature Coupler

The 3 dB Quadrature Coupler is a four port device covering the frequency range of 18 to 40 GHz . The coupler design is a single section Hopfer coupler which has been optimized to perform in the millimeter frequency range. See Fig. 1. It offers excellent amplitude and phase balance as well as low loss and high isolation. The 3 dB Quadrature Coupler utilizes removable connectors for easy integration into coaxial millimeter wave systems.

- Frequency range: 18-40 GHz
- Low insertion loss
- High isolation
- Removable connectors

## Millimeter Wave Components Custom Integrated Microwave Assemblies

## CUSTOM MILLIMETER WAVE ASSEMBLIES

KRATOS General Microwave has developed and produced various custom Millimeter Wave Integrated Microwave Assemblies (IMAs). The following are some examples of products we have developed:

1. Attenuator (Fig. 1)
2. One to four Power Divider (Fig. 2)
3. Transmitter Assembly (Fig 3)
4. Receiver Assembly (Fig. 4)

Fig. 1 - Custom Millimeter Wave Attenuator

Fig. 3 -Millimeter Wave Transmitter Assembly

Fig. 2 - Millimeter Wave Power Divider

Fig. 4-Millimeter Wave Receiver Assembly

General Microwave Corporation has been a leader in the field of microwave PIN diode control components for more than 30 years. A natural extension to its product line, microwave oscillators, was launched in 1989. It began with the introduction of an extremely stable (1 PPM $/{ }^{\circ} \mathrm{C}$ ) free running Dielectric Resonator Oscillator and has subsequently expanded to high performance Voltage Controlled and Digitally Tuned Oscillators. In this relatively short time, General Microwave has once again established itself as an industry leader. Its oscillator engineering staff has been recognized as a dynamic, innovative force who is willing and quite able to take on and solve today's most demanding problems.
General Microwave offers a broad line of General Purpose Signal Generators, this includes high-performance voltage-controlled oscillators (VCOs), digitally-tuned oscillators (DTOs), frequency locked oscillators (FLOs) and synthesizers in the microwave frequency range. The VCOs and DTOs feature fast-settling time, low post-tuning drift and low phase noise. In addition to General Microwave's standard catalog products, a wide
variety of custom oscillators have been developed for demanding airborne receiver, jamming and simulator applications.
This catalog is proof of General Microwave's success. It includes expanded versions of our general purpose catalog oscillator products and highlights many of the custom oscillators, both military and commercial, that have been successfully developed and manufactured. If your system requirements demand a device which cannot be found in this catalog, do not hesitate to contact General Microwave directly. A sales engineer will be happy to discuss your specific needs.
Modern microwave oscillators utilize a solid state device, such as a transistor or diode, together with a resonant circuit and matching network, to convert DC power to microwave power at a specified frequency. By appropriate choice of these elements, oscillators may be designed for an extremely wide range of applications. In addition, low frequency digital and analog control circuitry may be incorporated to provide further flexibility.

## Microwave Oscillators

## DEFINITION OF PARAMETERS

Frequency Settling/Post-Tuning Drift: The maximum deviation in frequency at a given time, following a change in tuning command, relative to the frequency one second after the change in tuning command. The worst-case condition usually occurs for frequency steps from one end of the band to the other. (Results of a typical measurement are shown in Fig. 1.) Settling time usually refers to the response up to several hundred microseconds, while post-tuning-drift usually refers to the variation from several hundred microseconds to as long as several hours.
Modulation Sensitivity Ratio: The ratio between the maximum and minimum slopes of the frequency vs. voltage tuning curve of a VCO over its frequency band. (For a DTO, this is defined at the FM modulation port.) Frequency Deviation Bandwidth: The peak-to-peak frequency deviation obtained for a given peak-to-peak voltage swing at the modulation port of a VCO or DTO. Modulation Bandwidth: The modulation frequency at which the frequency deviation bandwidth of a VCO or DTO decreases by 3 dB relative to the deviation bandwidth at low frequencies.
Phase Noise: The sideband noise level at a given deviation, $f_{m}$, from the oscillator frequency, relative to the carrier power level and normalized to a bandwidth of I Hz. From 10 kHz to 100 kHz , the phase noise of a VCO has a nominal $1 / f_{\mathrm{m}}{ }^{3}$ dependence. Thus, as shown in the figure, the phase noise at 100 kHz is approximately 30 dB lower than that at 10 kHz .
Residual FM: The peak-to-peak frequency deviation of an oscillator at its -3 dBc points, when measured on a spectrum analyzer with a resolution bandwidth of 1 kHz . (See Fig. 2).
Temperature Stability: The total oscillator frequency variation over the rated operating temperature, usually expressed in ppm $/{ }^{\circ} \mathrm{C}$.
Pulling: The maximum variation in oscillator frequency relative to its frequency when operating with a matched load, when the output load is rotated through a full $360^{\circ}$ phase change. The peak-to-peak variation in oscillator frequency is approximately twice the pulling figure defined above.

By using the following approximate formula, the pulling figure may be scaled as a function of the VSWR:

$$
\Delta f \text { peak-to-peak }=\frac{f_{0}}{2 Q_{E X T}}(S-1 / S)
$$

where $f_{o}$ is the oscillator frequency, $Q_{E X T}$ is the external $Q$ of the circuit, and $S$ is the load VSWR.

Pushing: The incremental change in oscillator frequency that results from an incremental change in power supply voltage.

Fig. 1-Measured settling time of 8-12 GHz VCO

Fig 2-Residual FM

## Microwave Synthesizers

KRATOS General Microwave (KGMI) has developed a broad line of General Purpose Synthesizers to be used in various applications. KGMI has developed a line of high performance, broadband Fast Indirect Synthesizers (FIS) to provide a cost-effective solution to the requirements of new systems. Its high speed (as fast as $1 \mu \mathrm{sec}$ ) provides an economical alternative to direct synthesizers for many applications. Because
of its low phase noise, it is an excellent alternate to the much slower and generally less reliable YIG based synthesizer.
To provide optimum solutions for different requirements, KRATOS General Microwave has developed a variety of Fast Indirect Synthesizers (FIS) with different parameter trade-offs: The standard FIS line for fastest tuning speed, the low phase noise line for ELINT applications and the compact FIS line for airborne small size applications.

SELECTION GUIDE SYNTHESIZERS

## Series SF60 Low Phase Noise 1usec Fast Indirect Synthesizer

- High Speed: $1 \mu \mathrm{sec}$
- Wide Frequency Range: 0.5 to 19 GHz
- Low Phase Noise
- Small Size
- High Reliability
- Severe Environmental Conditions

Synthesizer Model SF6218

SETTLING TIME
FROM 2 to 18 GHz

## Series SF60 Low Phase Noise Fast Indirect

 SynthesizerKRATOS General Microwave has developed the series SF60 fast, broadband, low phase noise and small size synthesizer, to meet the needs of a general purpose fast synthesizer for applications such as Signal Generators and Automatic Test Equipment at an affordable price.

For military applications, this synthesizer requires option G09 to comply with Military Standards. The specific environmental MIL STD requirements as well as the EMI/ RFI specifications should be provided by the customer.

SETTLING TIME
FROM 18 to 2 GHz

## Series SM60 $1 \mu$ sec Fast Indirect Synthesizer With Frequency Modulation

- High Speed: $1 \mu$ sec
- Wide Frequency Range: 2 to 18 GHz
- Modulation Span: 1 GHz
- Analog \& Digital Modulation Input
- Small Size
- High Reliability
- Severe Environmental Conditions

Synthesizer Model SM6218

## Series SM60 Low Phase Noise Fast Indirect Synthesizer

KRATOS General Microwave has enhanced the the series SF60 fast, broadband, indirect synthesizer by adding a modulation function. With this function, the synthesizer is well suited for use in various test systems where the signal output of the signal generator needs to be modulated rather than be just a CW signal.

The modulation input can be an analog voltage or a digital signal. This provides the system designer with more flexibility in his application and possibilities for complex modulation options. Fig. 1 is the spectrum of the output signal with a 1 MHz sine-wave modulation input.

Of special importance is the fact, that this synthesizer remains fully locked even during frequency modulation. As a result of it, the high frequency accuracy and other high performances of the synthesizer are kept all of the time. For this reason, in this synthesizer there isn't the "movement" of the center frequency nor the problem of non linearized modulation.

## APPLICATIONS

The Model SM6218 Fast Synthesizer, with Frequency Modulation capability, has been developed as an enhancement to the existing Series SF60 1 usec, CW Synthesizer family. It offers a higher performance and cost effective alternative to signal generators currently used in various applications such as Electronic Warfare (EW), Simulators, Test Systems and especially those which require improved frequency accuracy, phase noise and frequency modulation capabilities. In addition, the Model SM6218 design allows the flexibility to customize .performance to specific application requirements

- Wide Frequency Range: 2 to 20 GHz
- High Resolution: 100 Hz
- Low Cost
- Internal Reference

Synthesizer Model SW0120

## Series SW Compact Wide Frequency Band Indirect Synthesizer

Kratos General Microwave introduces the Synthesizer General Purpose Series SW Compact, Wide Band, Indirect Synthesizers offering exceptionally high performance at a low cost.

## APPLICATIONS

The Series SW synthesizer has been designed to be used in applications where small size, low cost and wideband operation are important requirements. It can be used as a Signal Generator in Portable Test Equipment, as microwave source in Built In Test (BIT) subassembly or in a broad frequency range electronic system.
For military applications, this synthesizer requires option G09 to comply with Military Standards. The specific environmental MIL STD requirements as well as the EMI/RFI specifications should be provided by the customer.

## Frequêncy Extender Series FE

## Series FE Frequency Extender

Kratos General Microwave introduces the series FE Frequency Extender to complement the Fast Indirect Synthesizer product line

The series FE Frequency Extender has been designed to extend, at a low cost, the frequency range of the high performance Fast Indirect Synthesizers enabling operation from 0.5 to 40 GHz .

The following product families may be used as an input source for the FE Frequency Extender: SW0120, SF6219, SM6220, D6218.

The SM6220 synthesizer is capable of wideband frequency modulation with a span of 1 GHz . The FE is supporting this capability through millimeter wave. The result of combining the SM6220 with the FE is a wideband synthesizer capable of wideband frequency modulation with a span of 1 GHz up to 40 GHz .

"1" - +2 to +5 V

## CONTROL COMMAND

- Switch control logic signals shall be 3 line binary coded TTL logic, as described in the Logic Table.
- Shut-Down Mode - the unit is set to J4 and there is no current to the frequency divider.

## Serieš SC0580 Narrow Frequency Band Synthêsizer

## Series SQ0580 Narrow Frequency Band Synthesizer

Kratos General Microwave introduces the Series SQ Narrow Band Synthesizer as a high performance, low cost alternative to a fixed frequency source.

APPLICATIONS
The Series SQ synthesizer has been designed to be used as the L.O. in various up and down frequency converters. It can be used as a replacement of a DRO, in applications that require high frequency stability over temperature and in operation under vibrations.

- Operating Frequency within 0.5 to 8 GHz
- High Frequency Accuracy
- High Frequency Stability
- Low Cost
- Compact Size
- High Reliability

## CUSTOM SYNTHESIZERS

## CUSTOM SYNTHESIZERS

Kratos General Microwave has delivered a large number of custom synthesizers for various applications. Most of these custom synthesizers were for airborne Electronic Warfare systems. Following is a sample of custom synthesizers we delivered to our customers.

## VME CONTROLLED SYNTHESIZER

## FEATURES

- Wide Frequency Range
- Fast Settling Time
- Low Power Consumption
- VME mechanical and control Interface

## CUSTÖM SYNTHESIZERS

- Broad Frequency Range
- Settling Time: 40 nsec.
- Phase Noise
@ 1 kHz: -91 dBc/Hz
@ 100 kHz: - 114 dBc/Hz
@ $1 \mathrm{MHz}:-116 \mathrm{dBc} / \mathrm{Hz}$
- Coherency Guaranteed

## BANK OF SYNTHESIZERS

## FEATURES

- Low Spurious
- Wide Frequency Range
- High Reliability

## CUSTOM SYNTHESZZERS

## SYNTHESIZER - FORM FIT REPLACEMENT

- Low Spurious
- Wide Frequency Range
- High Reliability
- Replacement for YIG

General Microwave offers a line of DTOs covering the 2-18 GHz frequency range based upon its catalog line of broadband VCOs. The DTO provides the desired output frequency in response to a digital control signal. A block diagram of the DTO is shown in Fig. 1. By appropriate design of the electronic circuitry, settling times of less than 300 nanoseconds are achieved. To obtain a frequency accuracy of the order of $\pm 1 \%$, including the effects of temperature, a proportionallycontrolled heater is required for the VCO and the electronic circuitry is temperature-compensated. A latch mode is provided as a standard feature.

To enable analog frequency modulation of the DTO, a separate frequency modulation port is provided. Since the slope of the frequency vs. voltage curve of the VCO varies over the frequency band, compensation is required to obtain a relatively constant deviation bandwidth. Compensation to within $\pm 5 \%$ is achieved (Option 2) by utilizing a PROM to vary the attenuation applied to the modulating signal. The DTO may be frequency modulated at rates of greater than 15 MHz .

Fig. 1-DTO Block Diagram

## Series D60 SingleBand DTOs

The Series D60 single-band DTO covers the frequency range of 0.5 to 18 GHz in 6 DTOs. Fig. 2 is the basic block diagram of the single band DTO.
When constant deviation bandwidth is required across the entire frequency band of the DTO, Option 2 should be used.

For military applications, these DTOs require option G09 to comply with Military Standards. The specific environmental MIL STD requirements as well as the EMI/RFI specifications should be provided by the customer.

- 1 to 18 GHZ in Various Sub-Band
- Fast Settling Time
- Modulation Capabilities
- High Reliability

## FOR RWR, ESM AND OTHER APPLICATIONS

KRATOS General Microwave offers a compact multiband DTOs for various airborne and other applications, covering the 2-6 and 6-18 GHz frequency ranges. The units feature high speed, high accuracy and low phase noise. The modular design of the DTOs enables the user to select narrower frequency coverage if desired. Please consult the factory for individual requirements.

- Fast Settling Time
- 2 to 18 GHz in Various Sub-Bands
- Small Size
- For Airborne Applications

## Notes:

1. GND is the DTOs analog ground for the $+15 \mathrm{~V},-15 \mathrm{~V}$ and +5 V supplies and not the heater's ground.
2. Warm up $3,000 \mathrm{~mA}$, steady state $1,000 \mathrm{~mA}$ max.

## CUSTOM DTOs

## CUSTOM MULTI-BAND DTOs

## Multi-Band DTO For EW and ESM Applications

General Microwave has developed numerous multi-band DTOs for demanding EW and ESM high-reliability applications, as shown in the

Fig. 1 - Multi-Band DTO (RF side view)

The C-Ku band DTO (Fig. 3) includes 3 fundamental mode VCOs and 1 push-push VCO, 4 MMIC amplifiers, a SP4T switch, a switched lowpass filter, and associated electronic circuitry. The key requirements

Fig. 3 - C-Ku Band DTO RF Assembly
photographs. The key requirements for the EW Multi-Band DTO , as seen in Figs. 1 and 2, are compact size, low spurious and harmonic levels, and 45 g rms endurance vibration levels. The unit includes 3 VCOs , 3 MMIC amplifiers, a switched lowpass filter, a custom hybrid electronic circuit, and RFI/EMI filtering.

Fig. 2 - Multi-Band DTO (Driver side view)
are suppression of the unused VCOs and fast settling tuning. The S-C band DTO (Fig. 4) meets similar requirements

## Multi-Bãnd Frequency Locked Oscillâtor (FLO)

## MULTI-BAND FREQUENCY LOCKED OSCILLATOR (FLO)

KRATOS General Microwave has developed a new product line of Multi-Band Frequency Locked Oscillators (FLO). This product line is an enhancement to our free running Digitally Tuned Oscillator (DTO) products. This FLO combines the high speed of DTO with the high accuracy and long-term stability of a frequency locked source. The key specification feature of the FLO is a timing speed of less than $1 \mu \mathrm{sec}$ to settle within 1 MHz of the desired frequency.

## SIMULATOR AND TEST SYSTEMS APPLICATIONS

The FLO was specifically designed for test systems and simulator applications. It is a low cost replacement for high cost direct synthesizers, in applications that the frequency setting time of 1 msec is meeting the system requirements.

- Fast Settling ( 1 MHz in $1 \mu \mathrm{sec}$ )
- Wideband (2-18 GHz)
- High Accuracy

## Voltagè Controlled Oscillators (VCOs)

## Broadband VCOs

General Microwave's catalog line of broadband VCOs covers the $2-18 \mathrm{GHz}$ frequency range in octave ( $2-4$, $2.6-5.2$ and $4-8 \mathrm{GHz}$ ) and half-octave ( $8-12$ and 12-18) GHz bands. The major features of the VCOs are fast settling time, low phase noise and excellent frequency stability.
A simplified block diagram is shown in Fig. 3. For optimum performance, the active element used is a silicon bipolar transistor. (This is in lieu of GaAs FETs which typically exhibit 10-20 dB poorer phase noise performance. Although GaAs FETs have extremely low noise in amplifier applications, they suffer from high $1 / f$ noise, which is upconverted in the nonlinear oscillator to phase noise near the carrier.) To vary the frequency of the oscillator, a high-Q silicon hyperabrupt varactor is utilized. The capacitance-voltage characteristic is specified to provide as nearly linear frequency vs. voltage tuning curve as possible. In practice, good linearity can only be realized over a small portion of the tuning range because of parasitic reactances present in the physical circuit and the bipolar transistor. Typical ratios of maximum to minimum frequency vs. voltage sensitivity for an octave band are 2:1 and are specified at 3:1. GaAs varactors, although having higher Q's than silicon varactors, suffer from long-term charging effects as well as relatively poor thermal conductivity. Silicon varactors are therefore mandatory in high-speed applications requiring settling times of the order of several hundred nanoseconds and low post-tuning drift.
To minimize pulling effects on the oscillator frequency due to variations in the external load, attenuator pads followed by buffer amplifiers are incorporated at the oscillator output. Voltage regulators are also included to minimize the effect of variations in the power supply voltage on both oscillator frequency and power level.

Finally, filtering is provided to reduce the harmonic content of the output signal.
Of particular note is General Microwave's $8-12 \mathrm{GHz}$ VCO, which utilizes a high performance transistor operating in the fundamental, rather than the doubling push-push mode. This mode of operation eliminates all $(2 n+1) f_{0} / 2$ frequencies in the output spectrum. The second harmonic signal is specified at -40 dBc maximum but is typically less than -50 dBc .
Because fundamental mode oscillation is not currently achievable with available silicon devices in the 12-18 GHz band, the doubling push-push approach, shown schematically in Fig. 4, is used. Thus, for example, for a 12 GHz output frequency, each oscillator is designed to operate at 6 GHz . If the structure were perfectly symmetrical, all odd harmonics of 6 GHz would be suppressed, and only even harmonics would be present in the output spectrum. By suitable filtering, an essentially pure 12 GHz output signal could be obtained. In practice, imperfect symmetry results in $\mathrm{f}_{\mathrm{o}} / 2$ and $3 \mathrm{f}_{\mathrm{o}} / 2$ signals, which are filtered to the extent possible. (For the case of a 12 GHz output signal, the undesired $3 \mathrm{f}_{\mathrm{o}} / 2$ signal at 18 GHz cannot be filtered since it is within the $12-18 \mathrm{GHz}$ frequency range of the VCO.)

| Storage temperature ( ${ }^{\circ} \mathrm{C}$ ) | -54 to +125 |  |  |  |
| MECHANICAL DIMENSIONS Inches | $0.97 \times 0.50 \times 0.20$ |  |  |  |
| Millimeters | $24,6 \times 12,7 \times 5,1$ |  |  |  |

(1) $\Delta f$ relative to $f$ after 1 millisec

## DIMENSIONS and WEIGHTS

Model V6020-95xJ

Dimensional Tolerances, unless otherwise indicated: .XX $\pm .02 ;$. $\mathrm{XXX} \pm .008$
All Models: 0.15 oz.; (4.34 grams) approx.

## CUSTOM VCOs

## Linear VCOs

For narrowband ( $<5 \%$ ) applications, General Microwave has developed proprietary techniques to achieve a high degree of linearity without the use of external linearizers.

## Linear X band

An X-band VCO assembly with linearity of less than $\pm 1 \%$ is shown in the photo. The assembly includes two MMIC amplifiers, a medium power MIC amplifier, two filters, a phase shifter and a MMIC SP2T switch. For specific requirements, please consult the factory.

## Linear Ku band

The photo shows a Ku-band VCO with a typical linearity of better than $\pm 5 \%$ for an airborne jamming application. The unit is designed for high speed modulation and also includes RFI/EMI filtering.

## Commercial GaAs FET X band

For X - and Ku-band applications where very low post-tuning drift and phase noise are not required, VCOs based upon GaAs FETs provide a cost-effective solution. In the photo, a GaAs FET X-band VCO, developed for a commercial radar application, is shown.

## KRATOS General Microwa Terms and Conditions of

1. CONTROLLING PROVISIONS: Seller is the division/subsidiary of KRATOS. that accepts the order of the Buyer. ALL SALES ARE EXPRESSLY LIMITED TO AND THE RIGHTS OF THE PARTIES SHALL BE GOVERNED EXCLUSIVELY BY THE TERMS AND CONDITIONS STATED HEREIN WHETHER THIS CONTRACT, OF WHICH THIS CONDITIONS OF SALE IS A PART, REPRESENTS AN OFFER BY SELLER OR SELLER'S CONDITIONAL ACCEPTANCE OF BUYER'S OFFER. SELLER'S OFFER IS EXPRESSLY CONDITIONED ON BUYER'S ACCEPTANCE OF THE TERMS AND CONDITIONS OF THIS CONTRACT. SELLER'S ACCEPTANCE OF BUYER'S OFFER IS EXPRESSLY CONDITIONED ON BUYER'S ASSENT TO THE TERMS AND CONDITIONS OF THIS CONTRACT No addition to, waiver or modification of these terms and conditions shall be binding on Seller unless expressly agreed to in writing by Seller. All quotations or resulting contracts shall be interpreted under the laws of the State of Delaware and exclude the provisions of the 1980 United Nations Convention on Contracts for the International Sale of Goods and the U. N. Convention on the Limitation Period in the International Sale of Goods, as amended by Protocol. No sale shall be final until acknowledged in writing by Seller. All offers involving the export of goods are contingent upon the ability of Seller to get required export license(s).
2. TERMS, TAXES AND PRICES: (a) Terms of payment are subject to the approval of Seller's credit department. Unless otherwise agreed to in writing by Seller, all payments are due net thirty (30) days from the date of invoice. In the event that the Buyer his failed to pay Seller for products or services ordered under different contracts or under this Contract as required by the terms and conditions of said contracts or Contract Seller, at its option shall have the right to make any delivery under this Contract payable on a cash before shipment basis. In the case of export sales, unless otherwise agreed to in writing by Seller, all payments are to be by means of a confirmed irrevocable letter of credit. (b) In addition to the prices specified in the Contract between the parties, (referred to in this Conditions of Sale as "Contract"), Buyer shall pay Seller the amount of any excise, sales, privilege, use or any other taxes or government charges, local, state or federal, which arise from the sale or delivery of the products, or in lieu thereof, Buyer shall provide Seller with a tax exemption certificate acceptable to the appropriate taxing authorities. (c) Prices and deliveries are F.O.B.. Ex Works Seller's plant. Prices on accepted orders and covering Seller-manufactured products are firm for a period of six months from date of acceptance. Seller reserves the right to increase the prices at the time of shipment to the extent of any increase in cost to it of any item not of Sellers manufacture on which firm prices were not available on the date of acceptance.
3. SHIPMENT: Deliveries are F.O.B. Ex Works Seller's plant. Risk of loss shall pass to the Buyer upon delivery to the carrier. Any claims for damage or loss in shipment are between the carrier and Buyer. Seller shall not be involved in such claims beyond Seller's assistance is processing and securing information pertaining to such damage claims.
4. DELAYS: The delivery date(s) under the Contract is only an estimate and is based upon prompt receipt of all necessary information from Buyer. The delivery date(s) is subject to and shall be extended by delays caused by strikes. fires, accidents, shortages of labor or materials, embargoes. or delays in transportation, compliance with government agency or official requests, or any other similar or dissimilar cause beyond the reasonable control of Seller. FAILURE TO DELIVER WITHIN THE TIME ESTIMATED SHALL: NOT BE A BREACH OF CONTRACT ON SELLER'S PART AND IN NO EVENT WHATSOEVER WILL SELLER BE RESPONSIBLE OR BUYER ENTITLED TO ANY DIRECT OR INDIRECT INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OR OF OR RELATING TO ANY DELAY IN DELIVERY. If Buyer causes Seller to delay shipment or completion of work, Seller shall be entitled to any and all extra cost and expenses resulting from such delay.
5. CANCELLATIONS AND ALTERATIONS: (a) Accepted orders may by cancelled by Buyer only with Seller's express written consent. If cancellation is allowed, Buyer agrees to pay to Seller all expenses incurred and damage sustained by Seller on account of such cancellation, plus a reasonable profit. (b) The delivery date(s) or specifications of accepted orders, whether completed or in process, cannot be altered except by Seller's express written consent and upon terms which will indemnify Seller for all expenses incurred and damages sustained by Seller on account of such alteration, plus a reasonable profit

# General Microwave and Conditions of Sale 

3. SHIPMENT: Deliveries are F.O.B. Ex Works Seller's plant. Risk of loss shall pass to the Buyer upon delivery to the carrier. Any claims for damage or loss in shipment are between the carrier and Buyer. Seller shall not be involved in such claims beyond Seller's assistance is processing and securing information pertaining to such damage claims.

#### Abstract

4. DELAYS: The delivery date(s) under the Contract is only an estimate and is based upon prompt receipt of all necessary information from Buyer. The delivery date(s) is subject to and shall be extended by delays caused by strikes. fires, accidents, shortages of labor or materials, embargoes. or delays in transportation, compliance with government agency or official requests, or any other similar or dissimilar cause beyond the reasonable control of Seller. FAILURE TO DELIVER WITHIN THE TIME ESTIMATED SHALL: NOT BE A BREACH OF CONTRACT ON SELLER'S PART AND IN NO EVENT WHATSOEVER WILL SELLER BE RESPONSIBLE OR BUYER ENTITLED TO ANY DIRECT OR INDIRECT INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OR OF OR RELATING TO ANY DELAY IN DELIVERY. If Buyer causes Seller to delay shipment or completion of work, Seller shall be entitled to any and all extra cost and expenses resulting from such delay.

5. CANCELLATIONS AND ALTERATIONS: (a) Accepted orders may by cancelled by Buyer only with Seller's express written consent. If cancellation is allowed, Buyer agrees to pay to Seller all expenses incurred and damage sustained by Seller on account of such cancellation, plus a reasonable profit. (b) The delivery date(s) or specifications of accepted orders, whether completed or in process, cannot be altered except by Seller's express written consent and upon terms which will indemnify Seller for all expenses incurred and damages sustained by Seller on account of such alteration, plus a reasonable profit

6 WARRANTY: Subject to the terms, conditions and limitations hereinafter set forth, Seller warrants, to the original Buyer only, each new product manufactured by seller to be free from defects in material and workmanship. Seller's entire and exclusive obligation and liability, and Buyer's sole and exclusive remedy, under the warranty is limited to repairing or replacing at Sellers option, free of charge; F.O.B. Ex Works Seller's plant, any part proving defective during the duration of this express warranty. The obligations of Seller under this warranty shall not include any transportation cost, labor costs,. installation costs. or other costs or charges associated with the repair or replacement This warranty shall not be enforceable if the Buyer is in default in making any contract payment The duration of this express warranty (a) for new equipment is one year from the date of shipment and (b) for any SELLER replacement part is 90 days after the date of installation, but no more than 6 months after shipment. This warranty does not cover failures caused in whole or in part by (1) improper installation, by other than SELLER, or maintenance; (2) improper use or application; (3) corrosion; (4) normal deterioration; (5) operation beyond rated capacity, (6) the use of replacement parts or lubricants which do not meet or exceed Seller's specifications, or (7) improper repairs. Products furnished, but not manufactured by Seller, are not covered by this warranty, but by only such warranties as are given by the said manufacturers to Seller. To qualify for warranty consideration at the earlier of the Buyer's discovery of the defect or the time at which the Buyer should have discovered the defect; Buyer must immediately notify Seller and must promptly thereafter return to Seller (freight prepaid) all defective parts. THIS WARRANTY IS EXCLUSIVE AND IN LIEU OF ALL OTHER EXPRESS OR IMPLIED WARRANTIES INCLUDING WITHOUT LIMITATION ANY WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WHICH ARE HEREBY DISCLAIMED THE OBLIGATION AND LIABILITY OF SELLER UNDER THE EXPRESS WARRANTY STATED SHALL NOT INCLUDE LIABILITY FOR LOSS OF USE, LOSS OF PROFITS OR ANY OTHER DIRECT OR INDIRECT INCIDENTAL OR CONSEQUENTIAL DAMAGES CAUSED BY THE FAILURE OF ITS PRODUCT OR ANY DEFECT IN THAT PRODUCT OR DELAY IN REMEDYING THE SAME.
7. LIABILITY: Seller shall not be liable to Buyer for (a) any losses; (b) any direct or indirect incidental or consequential damages or (c) any delays, caused by the failure of its product or any defect in that product, except to repair or replace defective parts as provided for in the Warranty provision. Seller's warranty runs only to Buyer and does not extend expressly or by implications, to any other person. Buyer agrees that Seller's fulfillment of its obligations under the Warranty provision shall constitute a fulfillment of all Seller's liabilities. whether in contract or in tort, with respect to the Contract. Buyer also agrees that Seller shall not be liable for any damages to Buyer or to a third person arising out of the presence of the installed products on Buyer's or third person's premises or out of the use or operation thereof. In no event whatsoever, shall Seller be held liable to Buyer for any direct or indirect incidental, exemplary, or consequential damages

## KRATOS General Microu Terms and Conditions of

8. PATENTS: Seller agrees to indemnify. Buyer against all damages and costs recovered in any patent litigation upon Buyer's use of Seller's products in the manner intended by Seller in an amount not exceeding the sum paid for the infringing products provided (a) Buyer immediately notifies the Seller in writing of any such claim of infringement (b) Buyer allows Seller to employ counsel, conduct the defense to a finality and assist Seller with the defense; and (c) Buyer shall have paid for all the products or shall not be in default in any of the required payments. Seller assumes no liability as to possible patent infringement by virtue of the use of its products in combination with other elements or structures or the use of products manufactured to Buyer specifications. If any of its products should be held in any such suit to constitute infringement and its use enjoined Seller shall have the right, at Seller's option, at its own expense, either to procure for Buyer the right to continue such use or to substitute, other non infringing or to remove such infringing products and refund to Buyer all money paid to Seller. Except as herein specifically provided, Seller shall not be liable to Buyer for any patent infringement by said products or any part thereof.
9. EQUIPMENT NOT SPECIFIED: Machinery, equipment, materials and labor services, including engineering or mechanical services. not specified in the Contract, are to be furnished in all cases by Buyer.
10. CHANGES OF CONSTRUCTION AND DESIGN: Seller reserves the right to change or revise the construction and design of the products purchased by Buyer, if in its judgment it is to its own or Buyer's best interest to do so. Buyer agrees to bear the expense of meeting any changes or modifications in regulatory or code requirements which become effective after Seller has accepted Buyer's order.
11. MATERIAL SPECIFIED BY CONTRACT: The Contract specifies the products supplied by Seller. The amount or the kind of such products is not changed nor increased by anything shown upon drawings furnished by Seller which are not a part of the Contract documents.
12. RETURNED PRODUCTS AND RESTOCKING: Including Products covered in paragraph 6, Products may not be returned without the express written consent of Seller and in accordance with shipping instructions from Seller. All transportation charges to and from Seller's factory are to be paid by Buyer. Products made to special order are not returnable. A restocking charge of not less than twenty percent (20\%) will apply on standard products accepted by Seller for a return and credit. Seller will not be responsible for the disposition of returned products unless the terms of this provision are complied with.
13. ENTIRE AGREEMENT: The parties agree that there an no agreements or representations express or implied, between the parties other than what is contained in this Contract of which this Conditions of Sale is a part. which represents the entire agreement between Seller and Buyer with the exception of those agreements, if any. expressly agreed to in writing by Seller. No course of prior dealings and no usage of the trade shall be relevant to supplement or explain any terms used in this Contract. The Contract between the parties may be modified or rescinded only by a writing signed by both Seller's contracts representative and Buyer's procurement representative.
14. CHARACTER OF PRODUCT AND SECURITY INTEREST: The products delivered by Seller under the terms of the Contract shall remain personal property and retain its character as such no matter in what manner affixed or attached to any structure or property. Buyer grants Seller a security interest in said products, including any proceeds there from, with remedy of self help until all sums due Seller have bean paid to it in cash.
15. FORCE MAJEURE: Neither party shall be liable in damages or have the right to terminate this Agreement for any delay or default in performing hereunder if such delay or default is caused by conditions beyond its control including, but not limited to Acts of God, Government restrictions (including the denial or cancellation of any export or other necessary license), wars, insurrections and/or any other cause beyond the reasonable control of the party whose performance is affected.

[^6]:    The specifications of the General Microwave Series 77 Digitally Controlled and Series 78 Voltage Controlled Frequency Translators include 25 dB carrier suppression and 20 dB sideband suppression over a three-to-one frequency range. Typical performance data for carrier and sideband suppression, of the 6 to 18 GHz Model 7728A, are shown in Figure 5. Carrier and sideband suppression of greater than 34 dB for a frequency translator covering a 15-percent bandwidth at $X$ band over the operating temperature range of $-54^{\circ} \mathrm{C}$ to $+100^{\circ} \mathrm{C}$ have been achieved in production quantities.
